**A VOYAGE TOWARDS THE SOUTH POLE, AND
ROUND THE WORLD; PERFORMED IN HIS
MAJESTY'S SHIPS THE RESOLUTION AND
ADVENTURE, IN THE YEARS 1772, 3, 4, AND 5.
WRITTEN BY JAMES COOK, COMMANDER OF
THE RESOLUTION. IN WHICH IS INCLUDED
CAPTAIN FURNEAUX'S NARRATIVE OF HIS
PROCEEDINGS IN THE ADVENTURE DURING THE
SEPARATION OF THE SHIPS. IN TWO VOLUMES.
ILLUSTRATED WITH MAPS AND CHARTS, AND A
VARIETY OF PORTRAITS OF PERSONS AND VIEWS
AND PLACES, DRAWN DURING THE VOYAGE BY
MR. HODGES, AND ENGRAVED BY THE MOST
EMINENT MASTERS.**

(1777)

* * *

CONTENTS OF THE SECOND VOLUME.

BOOK III. From Ulietea to New Zealand.

CHAPTER I. Passage from Ulietea to the Friendly Isles, with a Description of several Islands that were discovered, and the Incidents which happened in that Track.

CHAPTER II. Reception at Anamocka; a Robbery and its Consequences, with a Variety of other Incidents. Departure from the Island. A sailing Canoe described. Some Observations on the Navigation of these Islanders. A Description of the Island, and of those in the Neighbourhood, with some Account of the Inhabitants, and nautical Remarks.

CHAPTER III. The Passage from the Friendly Isles to the New Hebrides, with an Account of the Discovery of Turtle Island, and a Variety of Incidents which happened, both before and after the Ship arrived in Port Sandwich, in the Island of Mallicollo. A Description of the Port, the adjacent Country, its Inhabitants, and many other Particulars.

CHAPTER IV. An Account of the Discovery of several Islands, and an Interview and Skirmish with the Inhabitants upon one of them. The Arrival of the Ship at Tanna, and the Reception we met with there.

CHAPTER V. An Intercourse established with the Natives; some Account of the Island, and a Variety of Incidents that happened during our Stay at it.

CHAPTER VI. Departure from Tanna; with some Account of its Inhabitants, their Manners and Arts.

CHAPTER VII. The survey of the Islands continued, and a more particular Description of them.

CHAPTER VIII. An Account of the Discovery of New Caledonia, and the Incidents that happened while the Ship lay in Balade.

CHAPTER IX. A Description of the Country and its Inhabitants; their Manners, Customs, and Arts.

CHAPTER X. Proceedings on the Coast of New Caledonia, with Geographical and Nautical Observations.

CHAPTER XI. Sequel of the Passage from New Caledonia to New Zealand, with an Account of the Discovery of Norfolk Island; and the Incidents that happened while the Ship lay in Queen Charlotte's Sound.

BOOK IV. From leaving New Zealand to our Return to England.

CHAPTER I. The Run from New Zealand to Terra del Fuego, with the Range from Cape Deseada to Christmas Sound, and Description of that Part of the Coast.

CHAPTER II. Transactions in Christmas Sound, with an Account of the Country and its Inhabitants.

CHAPTER III. Range from Christmas Sound, round Cape Horn, through Strait Le Maire, and round Staten Land; with an Account of the Discovery of a Harbour in that Island, and a Description of the Coasts,

CHAPTER IV. Observations, geographical and nautical, with an Account of the Islands near Staten Land, and the Animals found in them,

CHAPTER V. Proceedings after leaving Staten Island, with an Account of the Discovery of the Isle of Georgia, and a Description of it,

CHAPTER VI. Proceedings after leaving the Isle of Georgia, with an Account of the Discovery of Sandwich Land; with some Reasons for there being Land about the South Pole,

CHAPTER VII. Heads of what has been done in the Voyage; with some Conjectures concerning the Formation of Ice-Islands; and an Account of our Proceedings till our Arrival at the Cape of Good Hope,

CHAPTER VIII. Captain Furneaux's Narrative of his Proceedings, in the Adventure, from the Time he was separated from the Resolution, to his Arrival in England; including Lieutenant Burney's Report concerning the Boat's Crew who were murdered by the Inhabitants of Queen Charlotte's Sound,

CHAPTER IX. Transactions at the Cape of Good Hope; with an Account of some Discoveries made by the French; and the Arrival of the Ship at St Helena,

CHAPTER X. Passage from St Helena to the Western Islands, with a Description of the Island of Ascension and Fernando Noronha,

CHAPTER XI. Arrival of the Ship at the Island of Fayal, a Description of the Place, and the Return of the Resolution to England.

Tables of the route of the Resolution and the Adventure, the variation of the compass and meteorological observations during the voyage.

A Vocabulary of the Language of the Society Isles.

A table, exhibiting at one view, specimens of different languages spoken in the South Sea, from Easter Island, westward to New Caledonia, as observed in the voyage.

Letter from John Ibbetson Esq., secretary to the Commissioners of Longitude, to Sir John Pringle, Baronet, P.R.S.

A discourse upon some late improvements of the means for preserving the health of mariners, delivered at the anniversary meeting of the Royal Society, Nov. 30, 1776. By Sir John Pringle, Bart. President.

A VOYAGE TOWARDS THE SOUTH POLE, AND ROUND THE WORLD.

BOOK III.

FROM ULIETEA TO NEW ZEALAND.

CHAPTER I.

Passage from Ulietea to the Friendly Isles, with a Description of several Islands that were discovered, and the Incidents which happened in that Track.

1774 June

On the 6th, being the day after leaving Ulietea, at eleven o'clock a.m., we saw land bearing N.W., which, upon a nearer approach, we found to be a low reef island about four leagues in compass, and of a circular form. It is composed of several small patches connected together by breakers, the largest lying on the N.E. part. This is Howe Island,

discovered by Captain Wallis, who, I think, sent his boat to examine it; and, if I have not been misinformed, found a channel through, within the reef, near the N.W. part. The inhabitants of Ulietea speak of an uninhabited island about this situation, called by them Mopeha, to which they go at certain seasons for turtle. Perhaps, this may be the same; as we saw no signs of inhabitants upon it. Its latitude is 16deg 46' S. longitude 154deg 8' W.

From this day to the 16th, we met nothing remarkable, and our course was west southerly; the winds variable from north round by the east to S.W., attended with cloudy, rainy, unsettled weather, and a southerly swell. We generally brought-to, or stood upon a wind during night; and in the day made all the sail we could. About half an hour after sunrise this morning, land was seen from the top-mast head, bearing N.N.E. We immediately altered the course, and steering for it, found it to be another reef island, composed of five or six woody islets, connected together by sand-banks and breakers inclosing a lake, into which we could see no entrance. We ranged the west and N.W. coasts, from its southern to its northern-extremity, which is about two leagues, and so near the shore, that at one time we could see the rocks under us; yet we found no anchorage, nor saw we any signs of inhabitants. There were plenty of various kinds of birds, and the coast seemed to abound with fish. The situation of this isle is not very distant from that assigned by Mr Dalrymple for La Sagitaria, discovered by Quiros; but, by the description the discoverer has given of it, it cannot be the same. For this reason, I looked upon it as a new discovery, and named it Palmerston Island, in honour of Lord Palmerston, one of the lords of the Admiralty. It is situated in latitude 18deg 4' S. longitude 163deg 10' W.

At four o'clock in the afternoon, we left this isle, and resumed our course to the W. by S. with a fine steady gale easterly, till noon on the 20th, at which time, being in latitude 18deg 50', longitude 168deg 52', we thought we saw land to S.S.W. and hauled up for it accordingly. But two hours after, we discovered our mistake, and resumed our course W. by S. Soon after, we saw land from the mast-head in the same direction; and, as we drew nearer, found it to be an island, which, at five o'clock, bore west, distant five leagues. Here we spent the night plying under the topsails; and at day-break next morning, bore away, steering to the northern point, and ranging the west coast at the distance of one mile, till near noon. Then perceiving some people on the shore, and landing seeming to be easy, we brought-to, and hoisted out two boats, with which I put off to the land, accompanied by some of the officers and gentlemen. As we drew near the shore, some of the inhabitants, who were on the rocks, retired to the woods, to meet us, as we supposed; and we afterwards found our conjectures right. We landed with ease in a small creek, and took post on a high rock to prevent a surprise. Here we displayed our colours, and Mr Forster and his party began to collect plants, etc. The coast was so over-run with woods, bushes, plants, stones, etc. that we could not see forty yards round us. I took two men, and with them entered a kind of chasm, which opened a way into the woods. We had not gone far before we heard the natives approaching; upon which I called to Mr Forster to retire to the party, as I did likewise. We had no sooner joined than the islanders appeared at the entrance of a chasm not a stone's throw from us. We began to speak, and make all the friendly signs we could think of, to them, which they answered by menaces; and one of two men, who were advanced before the rest, threw a stone, which struck Mr Sparman on the arm. Upon this two muskets were fired, without order, which made them all retire under cover of the woods; and we saw them no more.

After waiting for some little time, and till we were satisfied nothing was to be done here, the country being so overrun with bushes, that it was hardly possible to come to parley with them, we embarked and proceeded down along shore, in hopes of meeting with better success in another place. After ranging the coast for some miles, without seeing a living soul, or any convenient landing-place, we at length came before a small beach, on which lay four canoes. Here we landed by means of a little creek, formed by the flat rocks before it, with a view of just looking at the canoes, and to leave some medals, nails, etc. in them; for not a soul was to be seen. The situation of this place was to us worse than the former. A flat rock lay next the sea; behind it a narrow stone beach; this was bounded by a perpendicular rocky cliff of unequal height, whose top was covered with shrubs; two deep and narrow chasms in the cliff seemed to open a communication into the country. In or before one of these lay the four canoes which we were going to look at; but in the doing of this, I saw we should be exposed to an attack from the natives, if there were any, without being in a situation proper for defence. To prevent this, as much as could be, and to secure a retreat in case of an attack, I ordered the men to be drawn up upon the rock, from whence they had a view of the heights; and only myself, and four of the gentlemen, went up to the canoes. We had been there but a few minutes, before the natives, I cannot say how many, rushed down the chasm out of the wood upon us. The endeavours we used to bring them to a parley, were to no purpose; for they came with the ferocity of wild boars, and threw their darts. Two or three muskets, discharged in the air did not hinder one of them from advancing still farther, and throwing another dart, or rather a spear, which passed close over my shoulder. His courage would have cost him his life, had not my musket missed fire; for I was not five paces from him when he threw his spear, and had resolved to shoot him to save myself. I was glad afterwards that it happened as it did. At this instant, our men on the rock began to fire at others who appeared on the heights, which abated the ardour of the party we were engaged with, and gave us time to join our people, when I caused the firing to cease. The last discharge sent all the islanders to the woods, from whence they did not return so long as we remained. We did not know that any were hurt. It was remarkable, that when I joined our party, I tried my musket in the air, and it

went off as well as a piece could do. Seeing no good was to be got with these people, or at the isle, as having no port, we returned on board, and having hoisted in the boats, made sail to the W.S.W. I had forgot to mention in its proper order, that having put ashore a little before we came to this last place, three or four of us went upon the cliffs, where we found the country, as before, nothing but coral rocks, all over-run with bushes, so that it was hardly possible to penetrate into it; and we embarked again with intent to return directly on board, till we saw the canoes; being directed to the place by the opinion of some of us, who thought they heard some people.

The conduct and aspect of these islanders occasioned my naming it Savage Island. It is situated in the latitude 19deg 1' S. longitude 169deg 37' W. It is about eleven leagues in circuit; of a round form, and good height; and hath deep waters close to its shores. All the sea-coast, and as far inland as we could see, is wholly covered with trees, shrubs, etc.; amongst which were some cocoa-nut trees; but what the interior parts may produce we know not. To judge of the whole garment by the skirts, it cannot produce much; for so much as we saw of it consisted wholly of coral rocks, all over-run with woods and bushes. Not a bit of soil was to be seen; the rocks alone supplying the trees with humidity. If these coral rocks were first formed in the sea by animals, how came they thrown up to such an height? Has this island been raised by an earthquake? Or has the sea receded from it? Some philosophers have attempted to account for the formation of low isles, such as are in the sea; but I do not know that any thing has been said of high islands, or such as I have been speaking of. In this island, not only the loose rocks which cover the surface, but the cliffs which bound the shores, are of coral stone, which the continual beating of the sea has formed into a variety of curious caverns, some of them very large: The roof or rock over them being supported by pillars, which the foaming waves have formed into a multitude of shapes, and made more curious than the caverns themselves. In one we saw light was admitted through a hole at the top; in another place, we observed that the whole roof of one of these caverns had sunk in, and formed a kind of valley above, which lay considerably below the circumjacent rocks.

I can say but little of the inhabitants, who, I believe, are not numerous. They seemed to be stout well-made men, were naked except round the waists, and some of them had their faces, breasts, and thighs painted black. The canoes were precisely like those of Amsterdam; with the addition of a little rising like a gunwale on each side of the open part; and had some carving about them, which shewed that these people are full as ingenious. Both these islanders and their canoes agree very well with the description M. de Bougainville has given of those he saw off the Isle of Navigators, which lies nearly under the same meridian.

After leaving Savage Island, we continued to steer W.S.W. with a fine easterly trade-wind, till the 24th in the evening, when, judging ourselves not far from Rotterdam, we brought-to, and spent the night plying under the top-sails. At daybreak next morning, we bore away west; and soon after, saw a string of islands extending from S.S.W. by the west to N.N.W. The wind being at N.E., we hauled to N.W., with a view of discovering more distinctly the isles in that quarter; but, presently after, we discovered a reef of rocks a-head, extending on each bow farther than we could see. As we could not weather them, it became necessary to tack and bear up to the south, to look for a passage that way. At noon the southernmost island bore S.W., distant four miles. North of this isle were three others, all connected by breakers, which we were not sure did not join to those we had seen in the morning, as some were observed in the intermediate space. Some islands were also seen to the west of those four; but Rotterdam was not yet in sight. Latitude 20deg 23' S. longitude 174deg 6' W. During the whole afternoon, we had little wind; so that at sunset, the southernmost isle bore W.N.W., distant five miles; and some breakers, we had seen to the south, bore now S.S.W. 1/2 W. Soon after it fell calm, and we were left to the mercy of a great easterly swell; which, however, happened to have no great effect upon the ship. The calm continued till four o'clock the next morning, when it was succeeded by a breeze from the south. At day-light, perceiving a likelihood of a passage between the islands to the north and the breakers to the south, we stretched in west, and soon after saw more islands, both to the S.W. and N.W., but the passage seemed open and clear. Upon drawing near the islands, we sounded, and found forty-five and forty fathoms, a clear sandy bottom. I was now quite easy, since it was in our power to anchor, in case of a calm; or to spend the night, if we found no passage. Towards noon some canoes came off to us from one of the isles, having two or three people in each; who advanced boldly alongside, and exchanged some cocoa-nuts, and shaddocks, for small nails. They pointed out to us Anamocka, or Rotterdam; an advantage we derived from knowing the proper names. They likewise gave us the names of some of the other isles, and invited us much to go to theirs, which they called Comango. The breeze freshening, we left them astern, and steered for Anamocka; meeting with a clear passage, in which we found unequal sounding, from forty to nine fathoms, depending, I believe, in a great measure, on our distance from the islands which form it.

As we drew near the south end of Rotterdam, or Anamocka, we were met by a number of canoes, laden with fruit and roots; but as I did not shorten sail, we had but little traffic with them. The people in one canoe enquired for me by name; a proof that these people have an intercourse with those of Amsterdam. They importuned us much to go towards their coast, letting us know, as we understood them, that we might anchor there. This was on the S.W. side of the island, where the coast seemed to be sheltered from the S. and S.E. winds; but as the day was far spent, I could not attempt to go in there, as it would have been necessary to have sent first a boat to examine it. I therefore stood for the

north side of the island, where we anchored about three-fourths of a mile from shore; the extremes of it bearing south, 88deg E. to S.W.; a cove with a sandy beach at the bottom of it S. 50deg E.

CHAPTER II.

Reception at Anamocka; a Robbery and its Consequences, with a Variety of other Incidents. Departure from the Island. A sailing Canoe described. Some Observations on the Navigation of these Islanders. A Description of the Island, and of those in the Neighbourhood, with some Account of the Inhabitants, and nautical Remarks.

1774 June

Before we had well got to an anchor, the natives came off from all parts in canoes, bringing with them yams and shaddocks, which they exchanged for small nails and old rags. One man taking a vast liking to our lead and line, got hold of it, and, in spite of all the threats I could make use of, cut the line with a stone; but a discharge of small shot made him return it. Early in the morning, I went ashore with Mr Gilbert to look for fresh water. We landed in the cove above-mentioned, and were received with great courtesy by the natives. After I had distributed some presents amongst them, I asked for water, and was conducted to a pond of it that was brackish, about three-fourths of a mile from the landing-place, which I supposed to be the same that Tasman watered at. In the mean time, the people in the boat had laden her with fruit and roots, which the natives had brought down, and exchanged for nails and beads. On our return to the ship, I found the same sort of traffic carrying on there. After breakfast, I went ashore with two boats to trade with the people, accompanied by several of the gentlemen, and ordered the launch to follow with casks to be filled with water. The natives assisted us to roll them to and from the pond; and a nail or a bead was the expence of their labour. Fruits and roots, especially shaddocks and yams, were brought down in such plenty, that the two boats were laden, sent off, cleared, and laden a second time, before noon; by which time also the launch had got a full supply of water, and the botanical and shooting parties had all come in, except the surgeon, for whom we could not wait, as the tide was ebbing fast out of the cove; consequently he was left behind. As there is no getting into the cove with a boat, from between half-ebb to half-flood, we could get off no water in the afternoon. However, there is a very good landing-place, without it, near the southern point, where boats can get ashore at all times of the tide. Here some of the officers landed after dinner, where they found the surgeon, who had been robbed of his gun. Having come down to the shore some time after the boats had put off, he got a canoe to bring him on board; but, as he was getting into her, a fellow snatched hold of the gun, and ran off with it. After that no one would carry him to the ship, and they would have stripped him, as he imagined, had he not presented a tooth-pick case, which they, no doubt, thought was a little gun. As soon as I heard of this, I landed at the place above-mentioned, and the few natives who were there fled at my approach. After landing I went in search of the officers, whom I found in the cove, where we had been in the morning, with a good many of the natives about them. No step had been taken to recover the gun, nor did I think proper to take any; but in this I was wrong. The easy manner of obtaining this gun, which they now, no doubt, thought secure in their possession, encouraged them to proceed in these tricks, as will soon appear. The alarm the natives had caught being soon over, they carried fruit, etc. to the boats, which got pretty well laden before night, when we all returned on board.

Early in the morning of the 28th, Lieutenant Clerke, with the master and fourteen or fifteen men, went on shore in the launch for water. I did intend to have followed in another boat myself, but rather unluckily deferred it till after breakfast. The launch was no sooner landed than the natives gathered about her, behaving in so rude a manner, that the officers were in some doubt if they should land their casks; but, as they expected me on shore soon, they ventured, and with difficulty got them filled, and into the boat again. In the doing of this Mr Clerke's gun was snatched from him, and carried off; as were also some of the cooper's tools; and several of the people were stripped of one thing or another. All this was done, as it were, by stealth; for they laid hold of nothing by main force. I landed just as the launch was ready to put off; and the natives, who were pretty numerous on the beach, as soon as they saw me, fled; so that I suspected something had happened. However, I prevailed on many to stay, and Mr Clerke came, and informed me of all the preceding circumstances. I quickly came to a resolution to oblige them to make restitution; and, for this purpose, ordered all the marines to be armed and sent on shore. Mr Forster and his party being gone into the country, I ordered two or three guns to be fired from the ship, in order to alarm him; not knowing how the natives might act on this occasion. These orders being given, I sent all the boats off but one, with which I staid, having a good many of the natives about me, who behaved with their usual courtesy. I made them so sensible of my intention, that long before the marines came, Mr Clerke's musket was brought; but they used many excuses to divert me from insisting on the other. At length Mr Edgcumbe arriving with the marines, this alarmed them so much, that some fled. The first step I took was to seize on two large double sailing canoes, which were in the cove. One fellow making resistance, I fired some small shot at him, and sent him limping off. The natives being now convinced that I was in earnest, all fled; but on my calling to them, many returned; and, presently after, the other musket was brought, and laid down at my feet. That moment, I ordered the canoes to be restored, to shew them on what account they were detained. The other things we had lost being of less value, I was the more indifferent about them. By this time the launch was ashore for another turn of water,

and we were permitted to fill the casks without any one daring to come near us; except one man, who had befriended us during the whole affair, and seemed to disapprove of the conduct of his countrymen.

On my returning from the pond to the cove, I found a good many people collected together, from whom we understood that the man I had fired at was dead. This story I treated as improbable, and addressed a man, who seemed of some consequence, for the restitution of a cooper's adze we had lost in the morning. He immediately sent away two men, as I thought, for it; but I soon found that we had greatly mistaken each other; for instead of the adze, they brought the wounded man, stretched out on a board, and laid him down by me, to all appearance dead. I was much moved at the sight; but soon saw my mistake, and that he was only wounded in the hand and thigh. I, therefore, desired he might be carried out of the sun, and sent for the surgeon to dress his wounds. In the mean time, I addressed several people for the adze; for as I had now nothing else to do, I determined to have it. The one I applied the most to, was an elderly woman, who had always a great deal to say to me, from my first landing; but, on this occasion, she gave her tongue full scope. I understood but little of her eloquence; and all I could gather from her arguments was, that it was mean in me to insist on the return of so trifling a thing. But when she found I was determined, she and three or four more women went away; and soon after the adze was brought me, but I saw her no more. This I was sorry for, as I wanted to make her a present, in return for the part she had taken in all our transactions, private as well as public. For I was no sooner returned from the pond, the first time I landed, than this old lady presented to me a girl, giving me to understand she was at my service. Miss, who probably had received her instructions, wanted, as a preliminary article, a spike-nail or a shirt, neither of which I had to give her, and soon made them sensible of my poverty. I thought, by that means, to have come off with flying colours; but I was mistaken; for they gave me to understand I might retire with her on credit. On my declining this proposal, the old lady began to argue with me; and then abuse me. Though I comprehended little of what she said, her actions were expressive enough, and shewed that her words were to this effect, sneering in my face, saying, What sort of a man are you, thus to refuse the embraces of so fine a young woman? For the girl certainly did not want beauty; which, however, I could better withstand, than the abuses of this worthy matron, and therefore hastened into the boat. They wanted me to take the young lady aboard; but this could not be done, as I had given strict orders, before I went ashore, to suffer no woman, on any pretence whatever, to come into the ship, for reasons which I shall mention in another place.

As soon as the surgeon got ashore, he dressed the man's wounds, and bled him; and was of opinion that he was in no sort of danger, as the shot had done little more than penetrate the skin. In the operation, some poultice being wanting, the surgeon asked for ripe plantains; but they brought sugar-cane, and having chewed it to a pulp, gave it him to apply to the wound. This being of a more balsamic nature than the other; proves that these people have some knowledge of simples. As soon as the man's wounds were dressed, I made him a present, which his master, or at least the man who owned the canoe, took, most probably to himself. Matters being thus settled apparently to the satisfaction of all parties, we repaired on board to dinner, where I found a good supply of fruit and roots, and, therefore, gave orders to get every thing in readiness to sail.

I now was informed of a circumstance which was observed on board; several canoes being at the ship, when the great guns were fired in the morning, they all retired, but one man, who was bailing the water out of his canoe, which lay alongside directly under the guns. When the first was fired, he just looked up, and then, quite unconcerned, continued his work. Nor had the second gun any other effect upon him. He did not stir till the water was all out of his canoe, when he paddled leisurely off. This man had, several times, been observed to take fruit and roots out of other canoes, and sell them to us. If the owners did not willingly part with them, he took them by force; by which he obtained the appellation of custom-house officer. One time, after he had been collecting tribute, he happened to be lying alongside of a sailing canoe which was on board. One of her people seeing him look another way, and his attention otherwise engaged, took the opportunity of stealing somewhat out of his canoe; they then put off, and set their sail. But the man, perceiving the trick they had played him, darted after them, and having soon got on board their canoe, beat him who had taken his things, and not only brought back his own, but many other articles which he took from them. This man had likewise been observed making collections on shore at the trading-place. I remembered to have seen him there; and, on account of his gathering tribute, took him to be a man of consequence, and was going to make him a present; but some of their people would not let me, saying he was no *Areeke* (that is, chief). He had his hair always powdered with some kind of white dust.

As we had no wind to sail this afternoon, a party of us went ashore in the evening. We found the natives everywhere courteous and obliging; so that, had we made a longer stay, it is probable we should have had no more reason to complain of their conduct. While I was now on shore, I got the names of twenty islands, which lie between the N.W. and N.E., some of them in sight. Two of them, which lie most to the west, viz. Amattafoa and Oghao, are remarkable on account of their great height. In Amattafoa, which is the westernmost, we judged there was a volcano, by the continual column of smoke we saw daily ascending from the middle of it.

Both Mr Cooper and myself being on shore at noon, Mr Wales could not wind up the watch at the usual time; and, as we did not come on board till late in the afternoon, it was forgotten till it was down. This circumstance was of no consequence, as Mr Wales had had several altitudes of the sun at this place, before it went down; and also had opportunities of taking some after.

At day-break on the 29th, having got under sail with a light breeze at west, we stood to the north for the two high islands; but the wind, scanting upon us, carried us in amongst the low isles and shoals; so that, we had to ply, to clear them. This gave time for a great many canoes to get up with us. The people in them brought for traffic various articles; some roots, fruits, and fowls, but of the latter not many. They took in exchange small nails, and pieces of any kind of cloth. I believe, before they went away, they stripped the most of our people of the few clothes the ladies at Otaheite had left them; for the passion for curiosities was as great as ever. Having got clear of the low isles, we made a stretch to the south, and did but fetch a little to windward of the south end of Anamocka; so that we got little by this day's plying. Here we spent the night, making short boards over that space with which we had made ourselves acquainted the preceding day.

On the 30th at day-break, stretched out for Amattafoa, with a gentle breeze at W.S.W. Day no sooner dawned than we saw canoes coming from all parts. Their traffic was much the same as it had been the day before, or rather better; for out of one canoe I got two pigs, which were scarce articles here. At four in the afternoon, we drew near the island of Amattafoa, and passed between it and Oghao, the channel being two miles broad, safe, and without soundings. While we were in the passage, we had little wind and calms. This gave time for a large sailing double canoe, which had been following us all the day, as well as some others with paddles, to come up with us. I had now an opportunity to verify a thing I was before in doubt about, which was, whether or no some of these canoes did not, in changing tacks, only shift the sail, and so proceed with that end foremost, which before was the stern. The one we now saw wrought in this manner. The sail is latteen, extending to a latteen yard above, and to a boom at the foot; in one word, it is like a whole mizzen, supposing the whole foot to be extended to a boom. The yard is slung nearly in the middle, or upon an equipoise. When they change tacks they throw the vessel up in the wind, ease off the sheet, and bring the heel or tack-end of the yard to the other end of the boat, and the sheet in like manner; there are notches, or sockets, at each end of the vessel in which the end of the yard fixes. In short, they work just as those do at the Ladrone Islands, according to Mr Walter's description*. When they want to sail large, or before the wind, the yard is taken out of the socket and squared. It must be observed, that all their sailing vessels are not rigged to sail in the same manner. Some, and those of the largest size, are rigged, so as to tack about. These have a short but pretty stout mast, which steps on a kind of roller that is fixed to the deck near the fore-part. It is made to lean or incline very much forward; the head is forked; on the two points of which the yard rests, as on two pivots, by means of two strong cleats of wood secured to each side of the yard, at about one-third its length from the tack or heel, which, when under sail, is confined down between the two canoes, by means of two strong ropes, one to and passing through a hole at the head of each canoe; for it must be observed, that all the sailing vessels of this sort are double. The tack being thus fixed, it is plain that, in changing tacks, the vessels must be put about; the sail and boom on the one tack will be clear of the mast, and on the other it will lie against it, just as a whole mizzen. However, I am not sure if they do not sometimes unlace that part of the sail from the yard which is between the tack and mast-head, and so shift both sail and boom leeward of the mast. The drawings which Mr Hodges made of these vessels seem to favour this supposition. The outriggers and ropes used for shrouds, etc. are all stout and strong. Indeed, the sail, yard, and boom, are all together of such an enormous weight, that strength is required.

[* See Lord Anson's Voyage.]

The summit of Amattafoa was hid in the clouds the whole day, so that we were not able to determine with certainty whether there was a volcano or no; but every thing we could see concurred to make us believe there was. This island is about five leagues in circuit. Oghao is not so much; but more round and peaked. They lie in the direction of N.N.W. 1/2 W. from Anamocka, eleven or twelve leagues distant; they are both inhabited, but neither of them seemed fertile.

We were hardly through the passage before we got a fresh breeze at south. That moment all the natives made haste to be gone, and we steered to the west; all sails set. I had some thoughts of touching at Amsterdam, as it lay not much out of the way; but as the wind was now, we could not fetch it; and this was the occasion of my laying my design aside altogether.

Let us now return to Anamocka, as it is called by the natives. It is situated in the latitude of 20deg 15' S.; longitude 174deg 31' W., and was first discovered by Tasman, and by him named Rotterdam. It is of a triangular form, each side whereof is about three and a half or four miles. A salt-water lake in the middle of it occupies not a little of its surface, and in a manner cuts off the S.E. angle. Round the island, that is, from the N.W. to the S., round by the N. and E., lie scattered a number of small isles, sand-banks, and breakers. We could see no end to their extent to the N.; and it is not

impossible that they reach as far S. as Amsterdam or Tongatabu. These, together with Middleburg or Eaoowee, and Pylstart, make a group, containing about three degrees of latitude and two of longitude, which I have named the Friendly Isles or Archipelago, as a firm alliance and friendship seems to subsist among their inhabitants, and their courteous behaviour to strangers entitles them to that appellation; under which we might, perhaps, extend their group much farther, even down to Boscawen and Keppell's Isles discovered by Captain Wallis, and lying nearly under the same meridian, and in the latitude of 15deg 53'; for, from the little account I have had of the people of these two isles they seem to have the same sort of friendly disposition we observed in our Archipelago.

The inhabitants, productions, etc. of Rotterdam, and the neighbouring isles, are the same as at Amsterdam. Hogs and fowls are, indeed, much scarcer; of the former having got but six, and not many of the latter. Yams and shaddocks were what we got the most of; other fruits were not so plenty. Not half of the isle is laid out in inclosed plantations as at Amsterdam; but the parts which are not inclosed, are not less fertile or uncultivated. There is, however, far more waste land on this isle, in proportion to its size, than upon the other; and the people seem to be much poorer; that is, in cloth, matting, ornaments, etc. which constitute a great part of the riches of the South-Sea islanders.

The people of this isle seem to be more affected with the leprosy, or some scrophulous disorder, than any I have seen elsewhere. It breaks out in the face more than any other part of the body. I have seen several whose faces were ruined by it, and their noses quite gone. In one of my excursions, happening to peep into a house where one or more of them were, one man only appeared at the door, or hole, by which I must have entered, and which he began to stop up, by drawing several parts of a cord across it. But the intolerable stench which came from his putrid face was alone sufficient to keep me out, had the entrance been ever so wide. His nose was quite gone, and his whole face in one continued ulcer; so that the very sight of him was shocking. As our people had not all got clear of a certain disease they had contracted at the Society Isles, I took all possible care to prevent its being communicated to the natives here; and I have reason to believe my endeavours succeeded.

Having mentioned a house, it may not be amiss to observe, that some here differ from those I saw at the other isles: being inclosed or walled on every side, with reeds neatly put together, but not close. The entrance is by a square hole, about two feet and a half each way. The form of these houses is an oblong square; the floor or foundation every way shorter than the eve, which is about four feet from the ground. By this construction, the rain that falls on the roof, is carried off from the wall, which otherwise would decay and rot.

We did not distinguish any king or leading chief, or any person who took upon him the appearance of supreme authority. The man and woman before mentioned, whom I believed to be man and wife, interested themselves on several occasions in our affairs; but it was easy to see they had no great authority. Amongst other things which I gave them as a reward for their service, was a young dog and bitch, animals which they have not, but are very fond of, and know very well by name. They have some of the same sort of earthen pots we saw at Amsterdam, and I am of opinion they are of their own manufacture, or that of some neighbouring isle.

The road, as I have already mentioned, is on the north side of the isle, just to the southward of the southernmost cove; for there are two on this side. The bank is of some extent, and the bottom free from rocks, with twenty-five and twenty fathoms water, one or two miles from the shore.

Fire-wood is very convenient to be got at, and easy to be shipped off; but the water is so brackish that it is not worth the trouble of carrying it on board; unless one is in great distress for want of that article, and can get no better. There is, however, better, not only on this isle, but on others in the neighbourhood; for the people brought us some in cocoa-nut shells which was as good as need be; but probably the springs are too trifling to water a ship.

I have already observed, that the S.W. side of the island is covered by a reef or reefs of rocks, and small isles. If there be a sufficient depth of water between them and the island, as there appeared to be, and a good bottom, this would be a much securer place for a ship to anchor in, than that where we had our station.

CHAPTER III.

The Passage from the Friendly Isles to the New Hebrides, with an Account of the Discovery of Turtle Island, and a Variety of Incidents which happened, both before and after the Ship arrived in Port Sandwich, in the Island of Mallicollo. A Description of the Port, the adjacent Country, its Inhabitants, and many other Particulars.

1774 July

On the first of July, at sun-rise, Amattafoa was still in sight, bearing N.E., distant twenty leagues. Continuing our course to the west, we, the next day at noon, discovered land bearing N.W. by W., for which we steered; and, upon a

nearer approach, found it to be a small island. At four o'clock it bore from N.W. half W. to N.W. by N., and, at the same time, breakers were seen from the masthead, extending from W. to S.W. The day being too far spent to make farther discoveries, we soon after shortened sail, hauled the wind, and spent the night, making short boards, which, at day-break, we found had been so advantageous that we were farther from the island than we expected, and it was eleven o'clock before we reached the N.W. or lee-side, where anchorage and landing seemed practicable. In order to obtain a knowledge of the former, I sent the master with a boat to sound, and, in the mean time, we stood on and off with the ship. At this time four or five people were seen on the reef, which lies round the isle, and about three times that number on the shore. As the boat advanced, those on the reef retired and joined the others; and when the boat landed they all fled to the woods. It was not long before the boat returned, when the master informed me that there were no soundings without the reef, over which, in one place only, he found a boat channel of six feet water. Entering by it, he rowed in for the shore, thinking to speak with the people, not more than twenty in number, who were armed with clubs and spears; but the moment he set his foot on shore, they retired to the woods. He left on the rocks some medals, nails, and a knife, which they no doubt found, as some were seen near the place afterwards. This island is not quite a league in length, in the direction of N.E. and S.W., and not half that in breadth. It is covered with wood, and surrounded by a reef of coral rocks, which in some places extend two miles from the shore. It seems to be too small to contain many inhabitants; and probably the few whom we saw, may have come from some isle in the neighbourhood to fish for turtle; as many were seen near this reef, and occasioned that name to be given to the island, which is situated in latitude 19deg 48' south, longitude 178deg 21' west.

Seeing breakers to the S.S.W., which I was desirous of knowing the extent of before night, I left Turtle Isle, and stood for them. At two o'clock we found they were occasioned by a coral bank, of about four or five leagues in circuit. By the bearing we had taken, we knew these to be the same breakers we had seen the preceding evening. Hardly any part of this bank or reef is above water at the reflux of the waves. The heads of some of the rocks are to be seen near the edge of the reef, where it is the shoalest; for in the middle is deep water. In short, this bank wants only a few little islets to make it exactly like one of the half-drowned isles so often mentioned. It lies S.W. from Turtle Island, about five or six miles, and the channel between it and the reef of that isle is three miles over. Seeing no more shoals or islands, and thinking there might be turtle on this bank, two boats were properly equipped and sent thither; but returned without having seen one.

The boats were now hoisted in, and we made sail to the west, with a brisk gale at east, which continued till the 9th, when we had for a few hours, a breeze at N.W., attended with squalls of rain. This was succeeded by a steady fresh gale at S.E., with which we steered N.W., being at this time in the latitude of 20deg 20' S. longitude 176deg 8' E.

On the 15th at noon, being in the latitude of 15deg 9' south, longitude 171deg 16' east, I steered west. The next day the weather was foggy, and the wind blew in heavy squalls, attended with rain, which in this ocean, within the tropics, generally indicates the vicinity of some high land. This was verified at three in the afternoon, when high land was seen bearing S.W. Upon this we took in the small sails, reefed the top-sails, and hauling up for it, at half-past five we could see it extend from S.S.W. to N.N.W. half W. Soon after we tacked and spent the night, which was very stormy, in plying. Our boards were disadvantageous; for, in the morning, we found we had lost ground. This, indeed, was no wonder, for having an old suit of sails bent, the most of them were split to pieces; particularly a fore-top-sail, which was rendered quite useless. We got others to the yards, and continued to ply, being desirous of getting round the south ends of the lands, or at least so far to the south as to be able to judge of their extent in that direction. For no one doubted that this was the Australia del Espiritu Santo of Quiros, which M. de Bougainville calls the Great Cyclades, and that the coast we were now upon was the east side of Aurora Island, whose longitude is 168deg 30' E.

The gale kept increasing till we were reduced to our low sails; so that, on the 18th, at seven in the morning, I gave over plying, set the top-sails double-reefed, bore up for, and hauled round the north end of Aurora Island, and then stretched over for the Isle of Lepers, under close-reefed topsails and courses, with a very hard gale at N.E.; but we had now the advantage of a smooth sea, having the Isle of Aurora to windward. At noon the north end of it bore N.E. 1/2 N., distant four leagues; our latitude, found by double altitudes, and reduced to this time, was 15deg 1' 30" south, longitude 168deg 14' east. At two o'clock p.m. we drew near the middle of the Isle of Lepers, and tacked about two miles from land; in which situation we had no soundings with a line of seventy fathoms. We now saw people on the shore, and many beautiful cascades of water pouring down the neighbouring hills. The next time we stood for this isle, we came to within half a mile of it, where we found thirty fathoms a sandy bottom; but a mile off we found no soundings at seventy fathoms. Here two canoes came off to us, in one of which were three men, and in the other but one. Though we made all the signs of friendship, we could not bring them nearer than a stone's throw; and they made but a short stay before they retired ashore, where we saw a great number of people assembled in parties, and armed with bows and arrows. They were of a very dark colour; and, excepting some ornaments at their breast and arms, seemed to be entirely naked.

As I intended to get to the south, in order to explore the land which might lie there, we continued to ply between the Isle of Lepers and Aurora; and on the 19th, at noon, the south end of the last-mentioned isle bore south 24deg east, and the north end north, distant twenty miles. Latitude observed 15deg 11'. The wind continued to blow strong at S.E., so that what we got by plying in the day, we lost in the night. On the 20th, at sun-rise, we found ourselves off the south end of Aurora, on the N.W. side of which, the coast forms a small bay. In this we made some trips to try for anchorage; but found no less than eighty fathoms water, the bottom a fine dark sand, at half a mile from shore. Nevertheless, I am of opinion that, nearer, there is much less depth, and secure riding; and in the neighbourhood is plenty of fresh water and wood for fuel. The whole isle, from the sea-shore to the summits of the hills, seemed to be covered with the latter; and every valley produced a fine stream of the former. We saw people on the shore, and some canoes on the coast, but none came off to us. Leaving the bay just mentioned, we stretched across the channel which divides Aurora from Whitsuntide Island. At noon we were abreast the north end of this latter, which bore E.N.E., and observed in 15deg 28' 1/2. The isle of Aurora bore from N. to N.E. 1/2 east, and the Isle of Lepers from N. by W. 1/2 W. to west. Whitsuntide Isle appeared joined to the land to the S. and S.W. of it; but in stretching to S.W. we discovered the separation. This was about four o'clock p.m., and then we tacked and stretched in for the island till near sun-set, when the wind veering more to the east, made it necessary to resume our course to the south. We saw people on the shore, smokes in many parts of the island, and several places which seemed to be cultivated. About midnight, drawing near the south land, we tacked and stretched to the north, in order to spend the remainder of the night.

At day-break on the 21st, we found ourselves before the channel that divides Whitsuntide Island from the south land, which is about two leagues over. At this time, the land to the southward extended from S. by E. round to the west, farther than the eye could reach, and on the part nearest to us, which is of considerable height, we observed two very large columns of smoke, which, I judged, ascended from volcanoes. We now stood S.S.W., with a fine breeze at S.E.; and, at ten o'clock, discovered this part of the land to be an island, which is called by the natives Ambrym. Soon after an elevated land appeared open off the south end of Ambrym; and after that, another still higher, on which is a high peaked hill. We judged these lands to belong to two separate islands. The first came in sight at S.E.; the second at E. by S., and they appeared to be ten leagues distant. Holding on our course for the land ahead, at noon it was five miles distant from us, extending from S.S.E. to N.W. by W., and appeared to be continued. The islands to the east bore from N.E. by E. to S.E. by E., latitude observed 16deg 17' south. As we drew nearer the shore we discovered a creek, which had the appearance of being a good harbour, formed by a low point or peninsula, projecting out to the north. On this a number of people were assembled, who seemed to invite us ashore; probably with no good intent, as the most of them were armed with bows and arrows. In order to gain room and time to hoist out and arm our boats, to reconnoitre this place, we tacked and made a trip off, which occasioned the discovery of another port about a league more to the south. Having sent two armed boats to sound and look for anchorage, on their making the signal for the latter, we sailed in S.S.W., and anchored in eleven fathoms water, not two cables' length from the S.E. shore, and a mile within the entrance.

We had no sooner anchored than several of the natives came off in canoes. They were very cautious at first; but, at last, trusted themselves alongside, and exchanged, for pieces of cloth, arrows; some of which were pointed with bone, and dipped in some green gummy substance, which we naturally supposed was poisonous. Two men having ventured on board, after a short stay, I sent them away with presents. Others, probably induced by this, came off by moon-light; but I gave orders to permit none to come alongside, by which means we got clear of them for the night.

Next morning early, a good many came round us, some in canoes, and others swimming. I soon prevailed on one to come on board, which he no sooner did, than he was followed by more than I desired; so that not only our deck, but rigging, was presently filled with them. I took four into the cabin, and gave them various articles, which they shewed to those in the canoes, and seemed much pleased with their reception. While I was thus making friends with those in the cabin, an accident happened that threw all into confusion, but in the end, I believe, proved advantageous to us. A fellow in a canoe having been refused admittance into one of our boats that lay alongside, bent his bow to shoot a poisoned arrow at the boat-keeper. Some of his countrymen prevented his doing it that instant, and gave time to acquaint me with it. I ran instantly on deck, and saw another man struggling with him; one of those who had been in the cabin, and had leaped out of the window for this purpose. The other seemed resolved, shook him off, and directed his bow again to the boat-keeper; but, on my calling to him, pointed it at me. Having a musquet in my hand loaded with small shot, I gave him the contents. This staggered him for a moment, but did not prevent him from holding his bow still in the attitude of shooting. Another discharge of the same nature made him drop it, and the others, who were in the canoe, to paddle off with all speed. At this time, some began to shoot arrows on the other side. A musquet discharged in the air had no effect; but a four-pound shot over their heads sent them off in the utmost confusion. Many quitted their canoes and swam on shore; those in the great cabin leaped out of the windows; and those who were on the deck, and on different parts of the rigging, all leaped overboard. After this we took no farther notice of them, but suffered them to come off and pick up their canoes; and some of them even ventured alongside of the ship. Immediately after

the great gun was fired, we heard the beating of drums on shore; which was, probably, the signal for the country to assemble in arms. We now got every thing in readiness to land, to cut some wood, which we were in want of, and to try to get some refreshments, nothing of this kind having been seen in any of the canoes.

About nine o'clock, we put off in two boats, and landed in the face of four or five hundred people, who were assembled on the shore. Though they were all armed with bows and arrows, clubs and spears, they made not the least opposition. On the contrary, seeing me advance alone, with nothing but a green branch in my hand, one of them, who seemed to be a chief, giving his bow and arrows to another, met me in the water, bearing also a green branch, which having exchanged for the one I held, he then took me by the hand, and led me up to the crowd. I immediately distributed presents to them, and, in the mean time, the marines were drawn up upon the beach. I then made signs (for we understood not a word of their language) that we wanted wood; and they made signs to us to cut down the trees. By this time, a small pig being brought down and presented to me, I gave the bearer a piece of cloth, with which he seemed well pleased. This made us hope that we should soon have some more; but we were mistaken. The pig was not brought to be exchanged for what we had, but on some other account, probably as a peace-offering. For, all we could say or do, did not prevail on them to bring down, after this, above half a dozen cocoa-nuts, and a small quantity of fresh water. They set no value on nails, or any sort of iron tools; nor indeed on any thing we had. They would, now and then, exchange an arrow for a piece of cloth; but very seldom would part with a bow. They were unwilling we should go off the beach, and very desirous we should return on board. At length, about noon, after sending what wood we had cut on board, we embarked ourselves; and they all retired, some one way and some another. Before we had dined, the afternoon was too far spent to do any thing on shore; and all hands were employed, setting up the rigging, and repairing some defects in it. But seeing a man bring along the strand a buoy, which they had taken in the night from the kedge-anchor, I went on shore for it, accompanied by some of the gentlemen. The moment we landed, it was put into the boat, by a man who walked off again without speaking one word. It ought to be observed, that this was the only thing they took, or even attempted to take from us, by any means whatever. Being landed near one of their plantations and houses, which were just within the skirts of the wood, I prevailed on the man to conduct me to them; but, though they suffered Mr Forster to go with me, they were unwilling any more should follow. These houses were something like those of the other isles; rather low, and covered with palm thatch. Some were enclosed, or walled round with boards; and the entrance to those was by a square hole at one end, which at this time was shut up, and they were unwilling to open it for us to look in. There were here about six houses, and some small plantations of roots, etc., fenced round with reeds as at the Friendly Isles. There were, likewise, some bread-fruit, cocoa-nut, and plaintain trees; but very little fruit on any of them. A good many fine yams were piled up upon sticks, or a kind of raised platform; and about twenty pigs, and a few fowls, were running about loose. After making these observations, having embarked, we proceeded to the S.E. point of the harbour, where we again landed and walked along the bench till we could see the islands to the S.E. already mentioned. The names of these we now obtained, as well as the name of that on which we were. This they called Mallicollo;* the island that first appeared over the south end of Ambrym is called Apee; and the other with the hill upon it Paoom. We found on the beach a fruit like an orange, called by them Abbimora; but whether it be fit for eating, I cannot say, as this was decayed.

[* Or Mallicolla. Some of our people pronounced it Manicolo or Manicola, and thus it is also writ in Quiros' Memorial, as printed by Dalrymple, vol. ii. p. 146.]

Proceeding next to the other side of the harbour, we there landed, near a few houses, at the invitation of some people who came down to the shore; but we had not been there five minutes before they wanted us to be gone. We complied, and proceeded up the harbour in order to sound it, and look for fresh water, of which, as yet, we had seen none, but the very little that the natives brought, which we knew not where they got. Nor was our search now attended with success; but this is no proof that there is not any. The day was too far spent to examine the place well enough to determine this point. Night having brought us on board, I was informed that no soul had been off to the ship; so soon was the curiosity of these people satisfied. As we were coming on board, we heard the sound of a drum, and, I think, of some other instruments, and saw people dancing; but us soon as they heard the noise of the oars, or saw us, all was silent.

Being unwilling to lose the benefit of the moon-light nights, which now happened, at seven a.m. on the 23d, we weighed; and, with a light air of wind, and the assistance of our boats, proceeded out of the harbour, the south end of which, at noon, bore W.S.W., distant about two miles.

When the natives saw us under sail, they came off in canoes, making exchanges with more confidence than before, and giving such extraordinary proofs of their honesty as surprised us. As the ship, at first, had fresh way through the water, several of them dropped astern after they had received our goods, and before they had time to deliver theirs in return. Instead of taking advantage of this, as our friends at the Society Isles would have done, they used their utmost efforts to get up with us, and to deliver what they had already been paid for. One man, in particular, followed us a

considerable time, and did not reach us till it was calm, and the thing was forgotten. As soon as he came alongside he held up the thing which several were ready to buy; but he refused to part with it, till he saw the person to whom he had before sold it, and to him he gave it. The person, not knowing him again, offered him something in return, which he refused, and shewed him what he had given him before. Pieces of cloth, and marble paper, were in most esteem with them; but edge-tools, nails, and beads, they seemed to disregard. The greatest number of canoes we had alongside at once did not exceed eight, and not more than four or five people in each, who would frequently retire to the shore all on a sudden, before they had disposed of half their things, and then others would come off.

At the time we came out of the harbour, it was about low water, and great numbers of people were then on the shoals or reefs which lie along the shore, looking, as we supposed, for shell and other fish. Thus our being on their coast, and in one of their ports, did not hinder them from following the necessary employments. By this time they might be satisfied we meant them no harm; so that, had we made a longer stay, we might soon have been upon good terms with this ape-like nation. For, in general, they are the most ugly, ill-proportioned people I ever saw, and in every respect different from any we had met with in this sea. They are a very dark-coloured and rather diminutive race; with long heads, flat faces, and monkey countenances. Their hair mostly black or brown, is short and curly; but not quite so soft and woolly as that of a negroe. Their beards are very strong, crisp, and bushy, and generally black and short. But what most adds to their deformity, is a belt or cord which they wear round the waist, and tie so tight over the belly, that the shape of their bodies is not unlike that of an overgrown pismire. The men go quite naked, except a piece of cloth or leaf used as a wrapper*.

[* The particular manner of applying the wrapper may be seen in Wafer's voyage, who mentions this singular custom as existing, though with some little variation, amongst the Indians of the Isthmus of Darien. See Wafer's Voyage, p. 140.]

We saw but few women, and they were not less ugly than the men; their heads, faces, and shoulders, are painted red; they wear a kind of petticoat; and some of them had something over their shoulders like a bag, in which they carry their children. None of them came off to the ship, and they generally kept at a distance when we were on shore. Their ornaments are ear-rings, made of tortoise-shell and bracelets. A curious one of the latter, four or five inches broad, wrought with thread or cord, and studded with shells, is worn by them just above the elbow. Round the right wrist they wear hogs' tusks, bent circular, and rings made of shells; and round their left, a round piece of wood, which we judged was to ward off the bow-string. The bridge of the nose is pierced, in which they wear a piece of white stone, about an inch and a half long. As signs of friendship they present a green branch, and sprinkle water with the hand over the head.

Their weapons are clubs, spears, and bows and arrows. The two former are made of hard or iron-wood. Their bows are about four feet long, made of a stick split down the middle, and are not circular. The arrows, which are a sort of reeds, are sometimes armed with a long and sharp point, made of the hard wood, and sometimes with a very hard point made of bone; and these points are all covered with a substance which we took for poison. Indeed the people themselves confirmed our suspicions, by making signs to us not to touch the point, and giving us to understand that if we were pricked by them we should die. They are very careful of them themselves, and keep them, always wrapped up in a quiver. Some of these arrows are formed with two or three points, each with small prickles on the edges, to prevent the arrow being drawn out of the wound.

The people of Mallicollo seemed to be a quite different nation from any we had yet met with, and speak a different language. Of about eighty words, which Mr Forster collected, hardly one bears any affinity to the language spoken at any other island or place I had ever been at. The letter R is used in many of their words; and frequently two or three being joined together, such words we found difficult to pronounce. I observed that they could pronounce most of our words with great ease. They express their admiration by hissing like a goose.

To judge of the country by the little water we saw of it, it must be fertile; but I believe their fruits are not so good as those of the Society or Friendly Isles. Their cocoa-nut trees, I am certain, are not; and their bread-fruit and plantains did not seem much better. But their yams appeared to be very good. We saw no other animals than those I have already mentioned. They have not so much as a name for a dog, and consequently have none, for which reason we left them a dog and a bitch; and there is no doubt they will be taken care of, as they were very fond of them.

After we had got to sea, we tried what effect one of the poisoned arrows would have on a dog. Indeed we had tried it in the harbour the very first night, but we thought the operation was too slight, as it had no effect. The surgeon now made a deep incision in the dog's thigh, into which he laid a large portion of the poison, just as it was scraped from the arrows, and then bound up the wound with a bandage. For several days after we thought the dog was not so well as it had been before, but whether this was really so, or only suggested by imagination, I know not. He was afterwards as if

nothing had been done to him, and lived to be brought home to England. However, I have no doubt of this stuff being of a poisonous quality, as it could answer no other purpose. The people seemed not unacquainted with the nature of poison, for when they brought us water on shore, they first tasted it, and then gave us to understand we might with safety drink it.

This harbour, which is situated on the N.E. side of Mallicollo, not far from the S.E. end, in latitude 16deg 25' 20" S., longitude 167deg 57' 23" E., I named Port Sandwich. It lies in S.W. by S. about one league, and is one-third of a league broad. A reef of rocks extends out a little way from each point, but the channel is of a good breadth, and hath in it from forty to twenty-four fathoms water. In the port, the depth of water is from twenty to four fathoms; and it is so sheltered that no winds can disturb a ship at anchor there. Another great advantage is, you can lie so near the shore, as to cover your people, who may be at work upon it.

CHAPTER IV.

An Account of the Discovery of several Islands, and an Interview and Skirmish with the Inhabitants upon one of them. The Arrival of the Ship at Tanna, and the Reception we met with there.

1774 July

Soon after we got to sea, we had a breeze at E.S.E. with which we stood over for Ambrym till three o'clock in the afternoon, when the wind veering to the E.N.E. we tacked and stretched to the S.E. and weathered the S.E. end of Mallicollo, off which we discovered three or four small islands, that before appeared to be connected. At sun-set the point bore S. 77deg W., distant three leagues, from which the coast seemed to trend away west. At this time, the isle of Ambrym extended from N. 3deg E. to N. 65deg E. The isle of Paoon from N. 76deg E. to S. 88deg E.; and the isle of Apee from S. 83deg E. to S. 43deg E. We stood for this last isle, which we reached by midnight, and then brought-to till day-break on the 24th, when we made sail to the S.E., with a view of plying up to the eastward on the south side of Apee. At sun-rise we discovered several more islands, extending from the S.E. point of Apee to the south as far as S.E. by S. The nearest to us we reached by ten o'clock, and not being able to weather it, we tacked a mile from its shore in fourteen fathoms water. This island is about four leagues in circuit, is remarkable by having three high peaked hills upon it, by which it has obtained that name. In the p.m. the wind veering more to the north, we resumed our course to the east; and having weathered Threehills, stood for the group of small isles which lie off the S.E. point of Apee. These I called Shepherd's Isles, in honour of my worthy friend Dr Shepherd, Plumian professor of astronomy at Cambridge. Having a fine breeze, I had thoughts of going through between them; but the channels being narrow, and seeing broken water in the one we were steering for, I gave up the design, and bore up, in order to go without, or to the south of them. Before this could be accomplished, it fell calm, and we were left to the mercy of the current, close to the isles, where we could find no soundings with a line of an hundred and eighty fathoms. We had now land or islands in every direction, and were not able to count the number which lay round us. The mountain on Paoon was seen over the east end of Apee, bearing N.N.W. at eight o'clock. A breeze at S.E. relieved us from the anxiety the calm had occasioned; and we spent the night in making short boards.

The night before we came out of Port Sandwich, two reddish fish, about the size of large bream, and not unlike them, were caught with hook and line. On these fish most of the officers, and some of the petty officers, dined the next day. The night following, every one who had eaten of them was seized with violent pains in the head and bones, attended with a scorching heat all over the skin, and numbness in the joints. There remained no doubt that this was occasioned by the fish being of a poisonous nature, and having communicated its bad effects to all who partook of them, even to the hogs and dogs. One of the former died about sixteen hours after; it was not long before one of the latter shared the same fate; and it was a week or ten days before all the gentlemen recovered. These must have been the same sort of fish mentioned by Quiros,* under the name of pargos, which poisoned the crews of his ships, so that it was some time before they recovered; and we should, doubtless, have been in the same situation, had more of them been eaten.

[* Dalrymple's Collection of Voyages, vol. I. p. 140, 141.]

At day break on the 25th, we made a short stretch to the east of Shepherd's Isles till after sun-rise, when seeing no more land in that direction, we tacked and stood for the island we had seen in the south, having a gentle breeze at S.E. We passed to the east of Threehills, and likewise of a low isle, which lies on the S.E. side of it, between a remarkable peaked rock which obtained the name of Monument, and a small island named Twohills, on account of two peaked hills upon it, disjoined by a low and narrow isthmus. The channel between this island and the Monument is near a mile broad, and twenty-four fathoms deep. Except this rock, which is only accessible to birds, we did not find an island on which people were not seen. At noon, we observed, in latitude 17deg 18' 30"; longitude, made from Port Sandwich, 45' E. In this situation, the Monument bore N. 16deg E. distant two miles; Twohills bore N. 25deg W. distant two miles, and

in a line with the S.W. part of Threehills; and the islands to the south extended from S. 16deg 30' E. to S. 42deg W.

Continuing our course to the south, at five p.m. we drew near the southern lands, which we found to consist of one large island, whose southern and western extremities extended beyond our sight, and three or four smaller ones lying off its north side. The two northernmost are much the largest, have a good height, and lie in the direction of E. by S. and W. by N. from each other, distant two leagues; I named the one Montagu and the other Hinchinbrook, and the large island Sandwich, in honour of my noble patron the Earl of Sandwich. Seeing broken water ahead, between Montagu and Hinchinbrook isles, we tacked; and soon after it fell calm. The calm continued till seven o'clock the next morning, when it was succeeded by a breeze from the westward. During the calm, having been carried by the currents and a S.E. swell, four leagues to the W.N.W., we passed Hinchinbrook Isle, saw the western extremity of Sandwich Island, bearing S.S.W., about five leagues distant, and at the same time discovered a small island to the west of this direction. After getting the westerly breeze, I steered S.E. in order to pass between Montagu Isle and the north end of Sandwich Island. At noon we were in the middle of the channel, and observed in latitude 17deg 31' S. The distance from one island to the other is about four or five miles; but the channel is not much above half that breadth, being contracted by breakers. We had no soundings in it with a line of forty fathoms.

As we passed Montagu Isle several people came down to the sea-side, and, by signs, seemed to invite us ashore. Some were also seen on Sandwich Island, which exhibited a most delightful prospect, being spotted with woods and lawns, agreeably diversified over the whole surface. It hath a gentle slope from the hills, which are of a moderate height, down to the sea coast. This is low, and guarded by a chain of breakers, so that there is no approaching it at this part. But more to the west, beyond Hinchinbrook Island, there seemed to run in a bay sheltered from the reigning winds. The examining it not being so much an object, with me as the getting to the south, in order to find the southern extremity of the Archipelago, with this view I steered S.S.E., being the direction of the coast of Sandwich Island. We had but just got through the passage, before the west wind left us to variable light airs and calms; so that we were apprehensive of being carried back again by the currents, or rather of being obliged to return, in order to avoid being driven on the shoals, as there was no anchorage, a line of an hundred and sixty fathoms not reaching to the bottom. At length a breeze springing up at S.W. we stood to S.E., and at sun-set the Monument bore N. 14deg 30' W., and Montagu Island N. 28deg W. distant three leagues. We judged we saw the S.E. extremity of Sandwich Island, bearing about S. by E.

We continued to stand S.E. till four a.m. on the 27th, when we tacked to the west. At sun-rise, having discovered a new land bearing south, and making in three hills, this occasioned us to tack and stand towards it. At this time Montagu Isle bore N. 52deg W., distant thirteen leagues; at noon it was nearly in the same direction, and the new land extended from S. 1/2 E. to S. by W., and the three hills seemed to be connected. Our latitude by observation, was 18deg 1' S., and the longitude, made from Port Sandwich, 1deg 23' E. We continued to stand to the S.E., with a gentle breeze at S.W. and S.S.W. till the 28th at sun-rise, when, the wind veering to the south, we tacked and stood to the west. The three hills mentioned above, we now saw, belonging to one island, which extended from S. 35deg to 71deg W. distant about ten or twelve leagues.

1774 August

Retarded by contrary winds, calms, and the currents, that set to N.W., we were three days in gaining this space; in which time we discovered an elevated land to the south of this; It first appeared in detached hummocks, but we judged it to be connected. At length, on the 1st of August, about ten a.m. we got a fine breeze at E.S.E., which soon after veered to N.E., and we steered for the N.W. side of the island. Reaching it about two p.m., we ranged the west coast at one mile from shore, on which the inhabitants appeared in several parts, and by signs invited us to land. We continued to sound without finding bottom, till we came before a small bay, or bending of the coast, where, near a mile from shore, we found thirty and twenty-two fathoms water, a sandy bottom. I had thoughts of anchoring here, but the wind almost instantly veered to N.W.; which being nearly on shore, I laid this design aside. Besides, I was unwilling to lose the opportunity that now offered of getting to the south-east, in order first to explore the lands which lay there. I therefore continued to range the coast to the south, at about the same distance from shore; but we soon got out of soundings. About a league to the south of this bay, which hath about two miles extent, is another more extensive. Towards the evening, the breeze began to abate, so that it was sun-set before we got the length of it. I intended not to stop here, and to stand to the south under an easy sail all night; but at eight o'clock, as we were steering S.S.E. we saw a light ahead. Not knowing but it might be on some low detached isle, dangerous to approach while dark, we hauled the wind, and spent the night standing off and on, or rather driving to and fro; for we had but very little wind.

At sun-rise on the 2d, we saw no more land than the coast we were upon; but found that the currents had carried us some miles to the north, and we attempted, to little purpose, to regain what we had lost. At noon we were about a league from the coast, which extended from S.S.E. to N.E. Latitude observed 18deg 45' S. In the afternoon, finding the ship to drift not only to the north, but in shore also, and being yet to the south of the bay we passed the day before, I

had thoughts of getting to an anchor before night, while we had it in our power to make choice of a place. With this view, having hoisted out two boats, one of them was sent ahead to tow the ship; in the other Mr Gilbert went to sound for anchorage. Soon after, the towing boat was sent to assist him. So much time was spent in sounding this bay, that the ship drove past, which made it necessary to call the boats on board to tow her off from the northern point. But this service was performed by a breeze of wind, which, that moment, sprung up at S.W.; so that as the boats got on board, we hoisted them in, and then bore up for the north side of the island, intending once more to try to get round by the east; Mr Gilbert informed me, that at the south part of the bay, he found no soundings till close to a steep stone beach, where he landed to taste a stream of water he saw there, which proved to be salt. Some people were seen there, but they kept at a distance. Farther down the coast, that is to the north, he found twenty, twenty-four, and thirty fathoms, three-fourths of a mile, or a mile, from shore, the bottom a fine dark sand.

On the 3d, at sun-rise, we found ourselves abreast a lofty promontory on the S.E. side of the island, and about three leagues from it. Having but little wind, and that from the south, right in our teeth, and being in want of fire-wood, I sent Lieutenant Clerke with two boats to a small islet which lies off the promontory, to endeavour to get some. In the mean time we continued to ply up with the ship; but what we gained by our sails, we lost by the current. At length towards noon, we got a breeze at E.S.E., and E., with which we could lie up for the head; and soon after Mr Clerke returned, having not been able to land, on account of a high surf on the shore. They met with no people on the isle; but saw a large bat, and some birds, and caught a water-snake. At six o'clock p.m. we got in with the land, under the N.W. side of the head, where we anchored in seventeen fathoms water, the bottom a fine dark sand, half a mile from shore; the point of the head bearing N. 18deg E., distant half a league; the little islet before-mentioned N.E. by E. 1/2 E., and the N.W. point of the bay N. 32deg W. Many people appeared on the shore, and some attempted to swim off to us; but having occasion to send the boat ahead to sound, they retired as she drew near them. This, however, gave us a favourable idea of them.

On the 4th, at day-break, I went with two boats to examine the coast, to look for a proper landing-place, wood, and water. At this time, the natives began to assemble on the shore, and by signs invited us to land. I went first to a small beach, which is towards the head, where I found no good landing, on account of some rocks which every where lined the coast. I, however, put the boat's bow to the shore, and gave cloth, medals, etc. to some people who were there. For this treatment they offered to haul the boats over the breakers to the sandy beach, which I thought a friendly offer, but had reason afterwards to alter my opinion. When they found I would not do as they desired, they made signs for us to go down into the bay, which we accordingly did, and they ran along shore abreast of us, their number increasing prodigiously. I put in to the shore in two or three places, but, not liking the situation, did not land. By this time, I believe, the natives conceived what I wanted, as they directed me round a rocky point, where, on a fine sandy beach, I stepped out of the boat without wetting a foot, in the face of a vast multitude, with only a green branch in my hand, which I had before got from one of them. I took but one man out of the boat with me, and ordered the other boat to lie to at a little distance off. They received me with great courtesy and politeness; and would retire back from the boat on my making the least motion with my hand. A man, whom I took to be a chief, seeing this, made them form a semicircle round the boat's bow, and beat such as attempted to break through this order. This man I loaded with presents, giving likewise to others, and asked by signs for fresh water, in hopes of seeing where they got it. The chief immediately sent a man for some, who ran to a house, and presently returned with a little in a bamboo; so that I gained but little information by this. I next asked, by the same means, for something to eat, and they as readily brought me a yam, and some cocoa-nuts. In short, I was charmed with their behaviour; and the only thing which could give the least suspicion was, that most of them were armed with clubs, spears, darts, and bows and arrows. For this reason I kept my eye continually upon the chief, and watched his looks as well as his actions. He made many signs to me to haul the boat up upon the shore, and at last slipped into the crowd, where I observed him speak to several people, and then return to me, repeating signs to haul the boat up, and hesitating a good deal before he would receive some spike-nails, which I then offered him. This made me suspect something was intended, and immediately I stepped into the boat, telling them by signs that I should soon return. But they were not for parting so soon, and now attempted by force, what they could not obtain by gentler means. The gang-board happened unluckily to be laid out for me to come into the boat, I say unluckily, for if it had not been out, and if the crew had been a little quicker in getting the boat off, the natives might not have had time to put their design in execution, nor would the following disagreeable scene have happened. As we were putting off the boat, they laid hold of the gang-board, and unhooked it off the boat's stern. But as they did not take it away, I thought this had been done by accident, and ordered the boat in again to take it up. Then they themselves hooked it over the boat's stern, and attempted to haul her ashore; others, at the same time, snatched the oars out of the people's hands. On my pointing a musket at them, they in some measure desisted, but returned in an instant, seemingly determined to haul the boat ashore. At the head of this party was the chief; the others, who could not come at the boat, stood behind with darts, stones, and bows and arrows in hand, ready to support them. Signs and threats having no effect, our own safety became the only consideration; and yet I was unwilling to fire on the multitude, and resolved to make the chief alone fall a victim to his own treachery; but my musket at this critical moment

missed fire. Whatever idea they might have formed of the arms we held in our hands, they must now have looked upon them as childish weapons, and began to let us see how much better theirs were, by throwing stones and darts, and by shooting arrows. This made it absolutely necessary for me to give orders to fire. The first discharge threw them into confusion; but a second was hardly sufficient to drive them off the beach; and after all, they continued to throw stones from behind the trees and bushes, and, every now and then, to pop out and throw a dart. Four lay, to all appearance, dead on the shore; but two of them afterwards crawled into the bushes. Happy it was for these people, that not half our muskets would go off, otherwise many more must have fallen. We had one man wounded in the cheek with a dart, the point of which was as thick as my finger, and yet it entered above two inches, which shews that it must have come with great force, though indeed we were very near them. An arrow struck Mr Gilbert's naked breast, who was about thirty yards off; but probably it had struck something before; for it hardly penetrated the skin. The arrows were pointed with hard wood.

As soon as we got on board, I ordered the anchor to be weighed, with a view of anchoring near the landing-place. While this was doing, several people appeared on the low rock point, displaying two oars we had lost in the scuffle. I looked on this as a sign of submission, and of their wanting to give us the oars. I was, nevertheless, prevailed on to fire a four-pound shot at them, to let them see the effect of our great guns. The ball fell short, but frightened them so much, that none were seen afterwards; and they left the oars standing up against the bushes.

It was now calm; but the anchor was hardly at the bow before a breeze sprung up at north, of which we took the advantage, set our sails, and plied out of the bay, as it did not seem capable of supplying our wants with that conveniency I wished to have. Besides, I always had it in my power to return to this place, in case I should find none more convenient farther south.

These islanders seemed to be a different race from those of Mallicollo; and spoke a different language. They are of the middle size, have a good shape, and tolerable features. Their colour is very dark, and they paint their faces, some with black, and others with red pigment. Their hair is very curly and crisp, and somewhat woolly. I saw a few women, and I thought them ugly; they wore a kind of petticoat made of palm-leaves, or some plant like it. But the men, like those of Mallicollo, were in a manner naked; having only the belt about the waist, and the piece of cloth, or leaf, used as a wrapper*. I saw no canoes with these people, nor were any seen in any part of this island. They live in houses covered with thatch, and their plantations are laid out by a line, and fenced round.

[* The particular manner of applying the wrapper may be seen in Wafer's voyage, who mentions this singular custom as existing, though with some little variation, amongst the Indians of the Isthmus of Darien. See Wafer's Voyage, p. 140.]

At two o'clock in the afternoon, we were clear of the bay, bore up round the head, and steered S.S.E. for the south end of the island, having a fine breeze at N.W. On the S.W. side of the head is a pretty deep bay, which seemed to run in behind the one on the N.W. side. Its shores are low, and the adjacent lands appeared very fertile. It is exposed to the S.E. winds; for which reason, until it be better known, the N.W. bay is preferable, because it is sheltered from the reigning winds; and the winds to which it is open, viz. from N.W. by N. to E. by N., seldom blow strong. The promontory, or peninsula, which disjoins these two bays, I named Traitor's Head, from the treacherous behaviour of its inhabitants. It is the N.E. point of the island, situated in the latitude 18deg 43' S. longitude 169deg 28' E., and terminates in a saddle-hill which is of height sufficient to be seen sixteen or eighteen leagues. As we advanced to S.S.E., the new island, we had before discovered, began to appear over the S.E. point of the one near us, bearing S. 1/2 E., distant ten or twelve leagues. After leaving this one, we steered for the east end of the other, being directed by a great light we saw upon it.

At one o'clock the next morning, drawing near the shore, we tacked and spent the remainder of the night making short boards. At sun-rise we discovered a high table land (an island) bearing E. by S., and a small low isle in the direction of N.N.E., which we had passed in the night without seeing it. Traitor's Head was still in sight, bearing N. 20deg W. distant fifteen leagues, and the island to the south extended from S. 7deg W. to S. 87deg W. distant three or four miles. We then found that the light we had seen in the night was occasioned by a volcano, which we observed to throw up vast quantities of fire and smoke, with a rumbling noise heard at a great distance. We now made sail for the island; and, presently after, discovered a small inlet which had the appearance of being a good harbour. In order to be better informed, I sent away two armed boats, under the command of Lieutenant Cooper, to sound it; and, in the meanwhile, we stood on and off with the ship, to be ready to follow, or give them any assistance they might want. On the east point of the entrance, we observed a number of people, and several houses and canoes; and when our boats entered the harbour, they launched some, and followed them, but came not near. It was not long before Mr Cooper made the signal for anchorage; and we stood in with the ship. The wind being at west, and our course S.S.W., we borrowed close to the west point, and passed over some sunken rocks, which might have been avoided, by keeping a little more to the

east, or about one-third channel over. The wind left us as soon as we were within the entrance, and obliged us to drop an anchor in four fathoms water. After this, the boats were sent again to sound; and, in the meantime, the launch was hoisted out, in order to carry out anchors to warp in by, as soon as we should be acquainted with the channel.

While we were thus employed, many of the natives got together in parties, on several parts of the shore, all armed with bows, spears, etc. Some swam off to us, others came in canoes. At first they were shy, and kept at the distance of a stone's throw; they grew insensibly bolder; and, at last, came under our stern, and made some exchanges. The people in one of the first canoes, after coming as near as they durst, threw towards us some cocoa-nuts. I went into a boat and picked them up, giving them in return some cloth and other articles. This induced others to come under the stern, and alongside, where their behaviour was insolent and daring. They wanted to carry off every thing within their reach; they got hold of the fly of the ensign, and would have torn it from the staff; others attempted to knock the rings off the rudder; but the greatest trouble they gave us was to look after the buoys of our anchors, which were no sooner thrown out of our boats, or let go from the ship, than they got hold of them. A few muskets fired in the air had no effect; but a four-pounder frightened them so much, that they quitted their canoes that instant, and took to the water. But as soon as they found themselves unhurt, they got again into their canoes, gave us some halloos, flourished their weapons, and returned once more to the buoys. This put us to the expence of a few musketoon shot, which had the desired effect. Although none were hurt, they were afterwards afraid to come near the buoys; very soon all retired on shore, and we were permitted to sit down to dinner undisturbed.

During these transactions, a friendly old man in a small canoe made several trips between us and the shore, bringing off each time a few cocoa-nuts, or a yam, and taking in exchange whatever we gave him. Another was on the gangway when the great gun was fired, but I could not prevail on him to stay there long. Towards the evening, after the ship was moored, I landed at the head of the harbour, in the S.E. corner, with a strong party of men, without any opposition being made by a great number of the natives who were assembled in two parties, the one on our right and the other on the left, armed with clubs, darts, spears, slings, and stones, bows, and arrows, etc. After distributing to the old people (for we could distinguish no chief), and some others, presents of cloth, medals, etc. I ordered two casks to be filled with water out of a pond about twenty paces behind the landing-place; giving the natives to understand, that this was one of the articles we wanted. Besides water, we got from them a few cocoa-nuts, which seemed to be in plenty on the trees; but they could not be prevailed upon to part with any of their weapons. These they held in constant readiness, and in the proper attitudes of offence and defence; so that little was wanting to make them attack us; at least we thought so, by their pressing so much upon us, and in spite of our endeavours to keep them off. Our early re-embarking probably disconcerted their scheme; and after that, they all retired. The friendly old man before mentioned, was in one of these parties; and we judged, from his conduct, that his temper was pacific.

CHAPTER V.

An Intercourse established with the Natives; some Account of the Island, and a Variety of Incidents that happened during our Stay at it.

August 1774

As we wanted to take in a large quantity both of wood and water, and as, when I was on shore, I had found it practicable to lay the ship much nearer the landing-place than she now was, which would greatly facilitate that work, as well as overawe the natives, and enable us better to cover and protect the working party on shore; with this view, on the 6th, we went to work to transport the ship to the place I designed to moor her in. While we were about this, we observed the natives assembling from all parts, and forming themselves into two parties, as they did the preceding evening, one on each side the landing-place, to the amount of some thousands, armed as before. A canoe, sometimes conducted by one, and at other times by two or three men, now and then came off, bringing a few cocoa-nuts or plantains. These they gave us without asking for any return; but I took care they should always have something. Their chief design seemed to invite us on shore. One of those who came off was the old man, who had already ingratiated himself into our favour. I made him understand, by signs, that they were to lay aside their weapons, took those which were in the canoe, and threw them overboard, and made him a present of a large piece of cloth. There was no doubt but he understood me, and made my request known to his countrymen. For as soon as he landed, we observed him to go first to the one party, and then to the other; nor was he, ever after, seen by us with any thing like a weapon in his hand. After this, three fellows came in a canoe under the stern, one of them brandishing a club, with which he struck the ship's side, and committed other acts of defiance, but at last offered to exchange it for a string of beads, and some other trifles. These were sent down to him by a line; but the moment they were in his possession, he and his companions paddled off in all haste, without giving the club or any thing else in return. This was what I expected, and indeed what I was not sorry for, as I wanted an opportunity to shew the multitude on shore, the effect of our fire arms, without materially hurting any of them. Having a fowling-piece loaded with small shot (No. 3) I gave the fellow the contents;

and, when they were above musquet-shot off, I ordered some of the musquetoons, or wall-pieces, to be fired, which made them leap out of the canoe, keep under her offside, and swim with her ashore. This transaction seemed to make little or no impression on the people there. On the contrary, they began to halloo, and to make sport of it.

After mooring the ship, by four anchors, with her broadside to the landing-place, hardly musquet-shot off, and placing our artillery in such a manner as to command the whole harbour, I embarked with the marines, and a party of seamen, in three boats, and rowed in for the shore. It hath been already mentioned, that the two divisions of the natives were drawn up on each side the landing-place. They had left a space between them of about thirty or forty yards, in which were laid, to the most advantage, a few small bunches of plantains, a yam, and two or three roots. Between these and the water were stuck upright in the sand, for what purpose I never could learn, four small reeds, about two feet from each other, in a line at right angles to the shore, where they remained for two or three days after. The old man before-mentioned, and two more, stood by these things, inviting us, by signs, to land; but I had not forgot the trap I was so near being caught in at the last island; and this looked something like it. We answered, by making signs for the two divisions to retire farther back, and give us more room. The old man seemed to desire them so to do, but no more regard was paid to him than to us. More were continually joining them, and, except two or three old men, not one unarmed. In short, every thing conspired to make us believe they meant to attack us as soon as we should be on shore; the consequence of which was easily supposed; many of them must have been killed and wounded, and we should hardly have escaped unhurt; two things I equally wished to prevent. Since, therefore, they would not give us the room required, I thought it was better to frighten them into it, than to oblige them by the deadly effect of our fire-arms. I accordingly ordered a musquet to be fired over the party on our right, which was by far the strongest body; but the alarm it gave them was momentary. In an instant they recovered themselves and began to display their weapons. One fellow shewed us his backside, in a manner which plainly conveyed his meaning.

After this I ordered three or four more musquets to be fired. This was the signal for the ship to fire a few great guns, which presently dispersed them; and then we landed, and marked out the limits, on the right and left, by a line. Our old friend stood his ground, though deserted by his two companions, and I rewarded his confidence with a present. The natives came gradually to us, seemingly in a more friendly manner; some even without their weapons, but by far the greatest part brought them; and when we made signs to lay them down, they gave us to understand that we must lay down ours first. Thus all parties stood armed. The presents I made to the old people, and to such as seemed to be of consequence, had little effect on their conduct. They indeed climbed the cocoa-nut trees, and threw us down the nuts, without requiring any thing for them; but I took care that they should always have somewhat in return. I observed that many were afraid to touch what belonged to us; and they seemed to have no notion of exchanging one thing for another. I took the old man (whose name we now found to be Paowang) to the woods, and made him understand, I wanted to cut down some trees to take on board the ship; cutting some down at the same time, which we put into one of our boats, together with a few small casks of water, with a view of letting the people see what it was we chiefly wanted. Paowang very readily gave his consent to cut wood; nor was there any one who made the least objection. He only desired the cocoa-nut trees might not be cut down. Matters being thus settled, we embarked and returned on board to dinner, and, immediately after, they all dispersed. I never learnt that any one was hurt by our shot, either on this or the preceding day; which was a very happy circumstance. In the afternoon having landed again, we loaded the launch with water, and having made three hauls with the seine, caught upwards of three hundred pounds of mullet and other fish. It was some time before any of the natives appeared, and not above twenty or thirty at last, amongst whom was our trusty friend Paowang, who made us a present of a small pig, which was the only one we got at this isle, or that was offered to us.

During the night the volcano, which was about four miles to the west of us, vomited up vast quantities of fire and smoke, as it had also done the night before; and the flames were seen to rise above the hill which lay between us and it. At every eruption it made a long rumbling noise like that of thunder, or the blowing up of large mines. A heavy shower of rain, which fell at this time, seemed to increase it; and the wind blowing from the same quarter, the air was loaded with its ashes, which fell so thick that every thing was covered with the dust. It was a kind of fine sand, or stone, ground or burnt to powder, and was exceedingly troublesome to the eyes.

Early in the morning of the 7th, the natives began again to assemble near the watering-place, armed as usual, but not in such numbers as at first. After breakfast, we landed, in order to cut wood and fill water. I found many of the islanders much inclined to be friends with us, especially the old people; on the other hand, most of the younger were daring and insolent, and obliged us to keep to our arms. I staid till I saw no disturbance was like to happen, and then returned to the ship, leaving the party under the command of Lieutenants Clerke and Edgcumbe. When they came on board to dinner, they informed me that the people continued to behave in the same inconsistent manner as in the morning; but more especially one man, whom Mr Edgcumbe was obliged to fire at, and believed he had struck with a swan shot. After that the others behaved with more discretion; and as soon as our people embarked they all retired. While we were sitting at dinner an old man came on board, looked into many parts of the ship, and then went ashore again.

In the afternoon, only a few of those who lived in the neighbourhood, with whom we were now upon a tolerable footing, made their appearance at the watering-place. Paowang brought us an axe which had been left by our people, either in the woods or on the beach, and found by some of the natives. A few other articles were afterwards returned to us, which either they had stolen, or we had lost by our negligence, so careful were they now not to offend us in this respect.

Early the next morning, I sent the launch, protected by a party of marines in another boat, to take in ballast, which was wanted. This work was done before breakfast; and after it, she was sent for wood and water, and with her the people employed in this service, under the protection of a serjeant's guard, which was now thought sufficient, as the natives seemed to be pretty well reconciled to us. I was told, that they asked our people to go home with them, on condition they stripped naked as they were. This shews that they had no design to rob them, whatever other they might have.

On the 9th, I sent the launch for more ballast, and the guard and wooders to the usual place. With these I went myself, and found a good many of the natives collected together, whose behaviour, though armed, was courteous and obliging; so that there was no longer any occasion to mark out the limits by a line; they observed them without this precaution. As it was necessary for Mr Wales's instruments to remain on shore all the middle of the day, the guard did not return to dinner, as they had done before, till relieved by others. When I came off, I prevailed on a young man, whose name was Wha-a-gou, to accompany me. Before dinner I shewed him every part of the ship; but did not observe that any thing fixed his attention a moment, or caused in him the least surprise. He had no knowledge of goats, dogs, or cats, calling them all hogs (*Booga* or *Boogas*). I made him a present of a dog and a bitch, as he shewed a liking to that kind of animal. Soon after he came on board, some of his friends followed in a canoe, and enquired for him, probably doubtful of his safety. He looked out of the quarter gallery, and having spoken to them, they went ashore, and quickly returned with a cock, a little sugar-cane, and a few cocoa-nuts, as a present to me. Though he sat down with us, he did but just taste our salt pork, but eat pretty heartily of yam, and drank a glass of wine. After dinner I made him presents, and then conducted him, ashore.

As soon as we landed, the youth and some of his friends took me by the hand, with a view, as I understood, to conduct me to their habitations. We had not gone far, before some of them, for what reason I know not, were unwilling I should proceed; in consequence of which the whole company stopped; and, if I was not mistaken, a person was dispatched for something or other to give me; for I was desired to sit down and wait, which I accordingly did. During this interval, several of our gentlemen passed us, at which they shewed great uneasiness, and importuned me so much to order them back, that I was at last obliged to comply. They were jealous of our going up the country, or even along the shore of the harbour. While I was waiting here, our friend Paowang came with a present of fruit and roots, carried by about twenty men; in order, as I supposed, to make it appear the greater. One had a small bunch of plantains, another a yam, a third a cocoa-nut, etc.; but two men might have carried the whole with ease. This present was in return for something I had given him in the morning; however, I thought the least I could do now, was to pay the porters.

After I had dispatched Paowang, I returned to Wha-a-gou and his friends, who were still for detaining me. They seemed to wait with great impatience for something, and to be unwilling and ashamed to take away the two dogs, without making me a return. As night was approaching, I pressed to be gone; with which they complied, and so we parted.

The preceding day, Mr Forster learnt from the people the proper name of the island, which they call Tanna; and this day I learnt from them the names of those in the neighbourhood. The one we touched at last is called Erromango; the small isle, which we discovered the morning we landed here, Immer; the Table island to the east, discovered at the same time, Erronan or Footoona; and an island which lies to the S.E. Annattom. All these islands are to be seen from Tanna.

They gave us to understand, in a manner which I thought admitted of no doubt, that they eat human flesh, and that circumcision was practised among them. They began the subject of eating human flesh, of their own accord, by asking us if we did; otherwise I should never have thought of asking them such a question. I have heard people argue, that no nation could be cannibals, if they had other flesh to eat, or did not want food; thus deriving the custom from necessity. The people of this island can be under no such necessity; they have fine pork and fowls, and plenty of roots and fruits. But since we have not actually seen them eat human flesh, it will admit of doubt with some, whether they are cannibals.

When I got on board, I learnt that, when the launch was on the west side of the harbour taking in ballast, one of the men employed in this work, had scalded his fingers in taking a stone up out of some water. This circumstance produced the discovery of several hot springs, at the foot of the cliff, and rather below high-water mark.

This day Mr Wales, and two or three of the officers advanced a little, for the first time, into the island. They met with a

small straggling village, the inhabitants of which treated them with great civility; and the next morning Mr Forster and his party made another excursion inland. They met with several fine plantations of plantains, sugar-canes, yams, etc.; and the natives were courteous and civil. Indeed, by this time, the people, especially those in our neighbourhood, were so well reconciled to us, that they shewed not the least dislike at our rambling about in the skirts of the woods, shooting, etc. In the afternoon some boys having got behind thickets, and having thrown two or three stones at our people who were cutting wood, they were fired at by the petty officers present on duty. Being ashore at that time, I was alarmed at hearing the report of the musquets, and seeing two or three boys run out of the wood. When I knew the cause I was much displeas'd at so wanton an use being made of our fire-arms, and took measures to prevent it for the future. Wind southerly, with heavy showers of rain.

During the night, and also all the 11th, the volcano was exceedingly troublesome, and made a terrible noise, throwing up prodigious columns of fire and smoke at each explosion, which happened every three or four minutes; and, at one time, great stones were seen high in the air. Besides the necessary work of wooding and watering, we struck the main-top-mast to fix new trestle-trees and back-stays. Mr Forster and his party went up the hill on the west side of the harbour, where he found three places from whence smoke of a sulphureous smell issued, through cracks and fissures in the earth. The ground about these was exceedingly hot, and parched or burnt, and they seemed to keep pace with the volcano; for, at every explosion of the latter, the quantity of smoke or steam in these was greatly increased, and forced out so as to rise in small columns, which we saw from the ship, and had taken for common fires made by the natives. At the foot of this hill are the hot-springs before mentioned.

In the afternoon, Mr Forster having begun his botanical researches on the other side of the harbour, fell in with our friend Paowang's house, where he saw most of the articles I had given him, hanging on the adjoining trees and bushes, as if they were not worthy of being under his roof.

On the 12th, some of the officers accompanied Mr Forster to the hot places he had been at the preceding day. A thermometer placed in a little hole made in one of them, rose from 80, at which it stood in the open air, to 170. Several other parts of the hill emitted smoke or steam all the day, and the volcano was unusually furious, insomuch that the air was loaded with its ashes. The rain which fell at this time was a compound of water, sand, and earth; so that it properly might be called showers of mire. Whichever way the wind was, we were plagued with the ashes; unless it blew very strong indeed from the opposite direction. Notwithstanding the natives seemed well enough satisfied with the few expeditions we had made in the neighbourhood, they were unwilling we should extend them farther. As a proof of this, some undertook to guide the gentlemen when they were in the country, to a place where they might see the mouth of the volcano. They very readily embraced the offer; and were conducted down to the harbour, before they perceived the cheat.

The 13th, wind at N.E., gloomy weather. The only thing worthy of note this day was, that Paowang being at dinner with us on board, I took the opportunity to shew him several parts of the ship, and various articles, in hopes of finding out something which they might value, and be induc'd to take from us in exchange for refreshments; for what we got of this kind was trifling. But he looked on every thing that was shewn him with the utmost indifference; nor did he take notice of any one thing, except a wooden sand-box, which he seemed to admire, and turned it two or three times over in his hand.

Next morning after breakfast, a party of us set out for the country, to try if we could not get a nearer and better view of the volcano. We went by the way of one of those hot smoking places before mentioned, and dug a hole in the hottest part, into which a thermometer of Fahrenheit's construction was put; and the mercury presently rose to 100deg. It remained in the hole two minutes and a half without either rising or falling. The earth about this place was a kind of white clay, had a sulphureous smell, and was soft and wet, the surface only excepted, over which was spread a thin dry crust, that had upon it some sulphur, and a vitriolic substance, tasting like alum. The place affected by the heat was not above eight or ten yards square; and near it were some fig-trees, which spread their branches over part of it, and seemed to like their situation. We thought that this extraordinary heat was caused by the steam of boiling water, strongly impregnated with sulphur. I was told that some of the other places were larger than this; though we did not go out of the road to look at them, but proceeded up the hill through a country so covered with trees, shrubs, and plants, that the bread-fruit and cocoa-nut trees, which, seem to have been planted here by nature, were, in a manner, choaked up. Here and there we met with a house, some few people, and plantations. These latter we found in different states, some of long standing, others lately cleared, and some only clearing, and before any thing had been planted. The clearing of a piece of ground for plantation, seemed to be a work of much labour, considering the tools they had to work with, which, though much inferior to those at the Society Isles, are of the same kind. Their method is, however, judicious, and as expeditious as it can well be. They lop off the small branches of the large trees, dig under the roots, and there burn the branches and small shrubs and plants which they root up. The soil, in some parts, is a rich black mould; in other parts, it seemed to be composed of decayed vegetables, and of the ashes the volcano sends forth

throughout all its neighbourhood. Happening to turn out of the common path, we came into a plantation where we found a man at work, who, either out of good-nature, or to get us the sooner out of his territories, undertook to be our guide. We followed him, accordingly, but had not gone far before we came to the junction of two roads, in one of which stood another man with a sling and a stone, which he thought proper to lay down when a musquet was pointed at him. The attitude in which we found him, the ferocity appearing in his looks, and his behaviour after, convinced us that he meant to defend the path he stood in. He, in some measure, gained his point, for our guide took the other road, and we followed, but not without suspecting he was leading us out of the common way. The other man went with us likewise, counting us several times over, and hallooing, as we judged, for assistance; for we were presently joined by two or three more, among whom was a young woman with a club in her hand. By these people we were conducted to the brow of a hill, and shewn a road leading down to the harbour, which they wanted us to take. Not choosing to comply, we returned to that we had left, which we pursued alone, our guide refusing to go with us. After ascending another ridge, as thickly covered with wood as those we had come over, we saw yet other hills between us and the volcano, which seemed as far off as at our first setting out. This discouraged us from proceeding farther, especially as we could get no one to be our guide. We therefore came to a resolution to return; and had but just put this in execution when we met between twenty and thirty people, whom the fellow before mentioned had collected together, with a design, as we judged, to oppose our advancing into the country; but as they saw us returning they suffered us to pass unmolested. Some of them put us into the right road, accompanied us down the hill, made us stop by the way, to entertain us with cocoa-nuts, plantains, and sugar-cane; and what we did not eat on the spot, they brought down the hill with us. Thus we found these people hospitable, civil, and good-natured, when not prompted to a contrary conduct by jealousy; a conduct I cannot tell how to blame them for, especially when I considered the light in which they must view us. It was impossible for them to know our real design; we enter their ports without their daring to oppose; we endeavour to land in their country as friends, and it is well if this succeeds; we land, nevertheless, and maintain the footing we have got, by the superiority of our fire-arms. Under such circumstances, what opinion are they to form of us? Is it not as reasonable for them to think that we are come to invade their country, as to pay them a friendly visit? Time, and some acquaintance with us, can only convince them of the latter. These people are yet in a rude state; and, if we may judge from circumstances and appearances, are frequently at war, not only with their neighbours, but among themselves; consequently must be jealous of every new face. I will allow there are some exceptions to this rule to be found in this sea; but there are few nations who would willingly suffer visitors like us to advance far into their country.

Before this excursion, some of us had been of opinion that these people were addicted to an unnatural passion, because they had endeavoured to entice some of our men into the woods; and, in particular, I was told, that one who had the care of Mr Forster's plant bag, had been once or twice attempted. As the carrying of bundles, etc. is the office of the women in this country, it had occurred to me, and I was not singular in this, that the natives might mistake him and some others for women. My conjecture was fully verified this day. For this man, who was one of the party, and carried the bag as usual, following me down the hill, by the words which I understood of the conversation of the natives, and by their actions, I was well assured that they considered him as a female; till, by some means, they discovered their mistake, on which they cried out, "Erramange! Erramange!" "It is a man! It is a man!" The thing was so palpable, that every one was obliged to acknowledge, that they had before mistaken his sex: and that, after they were undeceived, they seemed not to have the least notion of what we had suspected. This circumstance will shew how liable we are to form wrong conjectures of things, among people whose language we are ignorant of. Had it not been for this discovery, I make no doubt that these people would have been charged with this vile custom.

In the evening I took a walk with some of the gentlemen into the country on the other side of the harbour, where we had very different treatment from what we had met with in the morning. The people we now visited, among whom was our friend Paowang, being better acquainted with us, shewed a readiness to oblige us in every thing in their power. We came to the village which had been visited on the 9th. It consisted of about twenty houses, the most of which need no other description than comparing them to the roof of a thatched house in England, taken off the walls and placed on the ground. Some were open at both ends, others partly closed with reeds, and all were covered with palm thatch. A few of them were thirty or forty feet long, and fourteen or sixteen broad. Besides these, they have other mean hovels, which, I conceived, were only to sleep in. Some of these stood in a plantation, and I was given to understand, that in one of them lay a dead corpse. They made signs that described sleep, or death; and circumstances pointed out the latter. Curious to see all I could, I prevailed on an elderly man to go with me to the hut, which was separated from the others by a reed fence, built quite round it at the distance of four or five feet. The entrance was by a space in the fence, made so low as to admit one to step over. The two sides and one end of the hut were closed or built up in the same manner, and with the same materials, as the roof. The other end had been open, but was now well closed with mats, which I could not prevail on the man to remove, or suffer me to do it. There hung at this end of the hut a matted bag or basket, in which was a piece of roasted yam, and some sort of leaves, all quite fresh. I had a strong desire to see the inside of the hut but the man was peremptory in refusing this, and even shewed an unwillingness to permit me to look into the basket. He wore round his neck, fastened to a string, two or three locks of human hair; and a woman present

had several about her neck. I offered something in exchange for them, but they gave me to understand they could not part with them, as it was the hair of the person who lay in the hut. Thus I was led to believe that these people dispose of their dead in a manner similar to that of Otaheite. The same custom of wearing the hair is observed by the people of that island, and also by the New Zealanders. The former make tamau of the hair of their deceased friends, and the latter make ear-rings and necklaces of their teeth.

Near most of their large houses were fixed, upright in the ground, the stems of four cocoa-nut trees, in a square position, about three feet from each other. Some of our gentlemen who first saw them, were inclined to believe they were thus placed on a religious account; but I was now satisfied that it was for no other purpose but to hang cocoa-nuts on to dry. For when I asked, as well as I could, the use of them, a man took me to one, loaded with cocoa-nuts from the bottom to the top; and no words could have informed me better. Their situation is well chosen for this use, as most of their large houses are built in an open airy place, or where the wind has a free passage, from whatever direction it blows. Near most, if not all of them, is a large tree or two, whose spreading branches afford an agreeable retreat from the scorching sun. This part of the island was well cultivated, open and airy; the plantations were laid out by line, abounding with plantains, sugar-canes, yams and other roots, and stocked with fruit-trees. In our walk we met with our old friend Paowang, who, with some others, accompanied us to the water side, and brought with them, as a present, a few yams and cocoa-nuts.

On the 15th, having finished wooding and watering, a few hands only were on shore making brooms, the rest being employed on board setting up the rigging, and putting the ship in a condition for sea. Mr Forster, in his botanical excursion this day, shot a pigeon, in the craw of which was a wild nutmeg. He took some pains to find the tree, but his endeavours were without success. In the evening a party of us walked to the eastern sea-shore, in order to take the bearing of Annattom, and Erronan or Footoona. The horizon proved so hazy that I could see neither; but one of the natives gave me, as I afterwards found, the true direction of them. We observed that in all, or most of their sugar plantations, were dug holes or pits, four feet deep, and five or six in diameter; and on our enquiring their use, we were given to understand that they caught rats in them. These animals, which are very destructive to the canes, are here in great plenty. The canes, I observed, were planted as thick as possible round the edge of these pits, so that the rats in coming at them are the more liable to tumble in.

Next morning we found the tiller sprung in the rudder head, and, by some strange neglect, we had not a spare one on board, which we were ignorant of till now it was wanting. I knew but of one tree in the neighbourhood fit for this purpose, which I sent the carpenter on shore to look at, and an officer, with a party of men, to cut it down, provided he could obtain leave of the natives; if not, he was ordered to acquaint me. He understood that no one had any objection, and set the people to work accordingly. But as the tree was large, this required some time; and, before it was down, word was brought me that our friend Paowang was not pleased. Upon this I gave orders to desist, as we found that, by scarfing a piece to the inner end of the tiller, and letting it farther into the rudder-head, it would still perform its office. But as it was necessary to have a spare one on board, I went on shore, sent for Paowang, made him a present of a dog and a piece of cloth, and then explained to him that our great steering paddle was broken, and that I wanted that tree to make a new one. It was easy to see how well pleased every one present was, with the means I took to obtain it. With one voice they gave their consent, Paowang joining his also, which he perhaps could not have done without the others; for I do not know that he had either more property, or more authority, than the rest. This point being obtained, I took our friend on board to dinner, and after it was over, went with him ashore, to pay a visit to an old chief, who was said to be king of the island; which was a doubt with me. Paowang took little or no notice of him. I made him a present, after which he immediately went away, as if he got all he came for. His name was Geogy, and they gave him the title of Areeke. He was very old, but had a merry open countenance. He wore round his waist a broad red-and-white chequered belt, the materials and manufacture of which seemed the same as that of Otaheite cloth; but this was hardly a mark of distinction. He had with him a son, not less than forty-five or fifty years of age. A great number of people were at this time at the landing-place, most of them from distant parts. The behaviour of many was friendly; while others were daring and insolent, which I thought proper to put up with, as our stay was nearly at an end.

On the 17th, about ten o'clock, I went ashore, and found in the crowd old Geogy and his son, who soon made me understand that they wanted to dine with me; and accordingly I brought them and two more on board. They all called them Areekees (or kings); but I doubt if any of them had the least pretensions to that title over the whole island. It had been remarked, that one of these kings had not authority enough to order one of the people up into a cocoa-nut tree, to bring him down some nuts. Although he spoke to several, he was at last obliged to go himself, and, by way of revenge, as it was thought, left not a nut on the tree, taking what he wanted himself, and giving the rest to some of our people.

When I got them on board, I went with them all over the ship, which they viewed with uncommon surprise and attention. We happened to have for their entertainment a kind of pie or pudding made of plantains, and some sort of greens which we had got from one of the natives. On this and on yams they made a hearty dinner; for, as to the salt

beef and pork, they would hardly taste them. In the afternoon, having made each of them a present of a hatchet, a spike-nail, and some medals, I conducted them ashore.

Mr Forster and I then went over to the other side of the harbour, and, having tried, with Fahrenheit's thermometer, the head of one of the hot springs, we found that the mercury rose to 191deg. At this time the tide was up within two or three feet of the spring, so that we judged, it might, in some degree, be cooled by it. We were mistaken however, for on repeating the experiment next morning, when the tide was out, the mercury rose no higher than 187deg; but, at another spring, where the water bubbled out of the sand from under the rock at the S.W. corner of the harbour, the mercury in the same thermometer rose to 202deg-1/2, which is but little colder than boiling water. The hot places before mentioned are from about three to four hundred feet perpendicular above these springs, and on the slope of the same ridge with the volcano; that is, there are no vallies between them, but such as are formed in the ridge itself; nor is the volcano on the highest part of the ridge, but on the S.E. side of it. This is, I have been told, contrary to the general opinion of philosophers, who say that volcanos must be on the summits of the highest hills. So far is this from being the case on this island, that some of its hills are more than double the height of that on which the volcano is, and close to it. To these remarks I must add, that, in wet or moist weather, the volcano was most violent. There seems to be room for some philosophical reasoning on these phenomena of nature; but not having any talent that way, I must content myself with stating facts as I found them, and leave the causes to men of more abilities.

The tiller was now finished; but, as the wind was unfavourable for sailing, the guard was sent on shore on the 19th as before, and a party of men to cut up and bring off the remainder of the tree from which we had got the tiller. Having nothing else to do, I went on shore with them, and finding a good number of the natives collected about the landing-place as usual, I distributed among them all the articles I had with me, and then went on board for more. In less than an hour I returned, just as our people were getting some large logs into the boat. At the same time four or five of the natives stepped forward to see what we were about, and as we did not allow them to come within certain limits, unless to pass along the beach, the centry ordered them, back, which they readily complied with. At this time, having my eyes fixed on them, I observed the sentry present his piece (as I thought at these men,) and was just going to reprove him for it, because I had observed that, whenever this was done, some of the natives would hold up their arms, to let us see they were equally ready. But I was astonished beyond measure when the sentry fired, for I saw not the least cause. At this outrage most of the people fled; it was only a few I could prevail on to remain. As they ran off, I observed one man to fall; and he was immediately lifted up by two others, who took him into the water, and washed his wound, and then led him off. Presently after, some came and described to me the nature of his wound; and as I found he was not carried far, I sent for the surgeon. As soon as he arrived, I went with him to the man, whom, we found expiring. The ball had struck his left arm, which was much shattered, and then entered his body by the short ribs, one of which was broken. The rascal who fired, pretended that a man had laid an arrow across his bow, and was going to shoot at him, so that he apprehended himself in danger. But this was no more than they had always done, and with no other view than to shew they were armed as well as we; at least I have reason to think so, as they never went farther. What made this incident the more unfortunate was, it not appearing to be the man who bent the bow, that was shot, but one who stood by him. This affair threw the natives into the utmost consternation; and a few that were prevailed on to stay, ran to the plantations and brought cocoa-nuts, etc. which they laid down at our feet. So soon, were those daring people humbled! When I went on board to dinner, they all retired, and only a few appeared in the afternoon, amongst whom were Paowang and Wha-a-gou. I had not seen this young man since the day he had dined on board. Both he and Paowang promised to bring me fruit, etc. the next morning, but our early departure put it out of their power.

CHAPTER VI.

Departure from Tanna; with some Account of its Inhabitants, their Manners and Arts.

1774 August

During the night the wind had veered round to S.E. As this was favourable for getting out of the harbour, at four o'clock in the morning of the 20th, we began to unmoor, and at eight, having weighed our last anchor, put to sea. As soon as we were clear of the land, I brought-to, waiting for the launch, which was left behind to take up a kedge-anchor and hawser we had out, to cast by. About day-break a noise was heard in the woods, nearly abreast of us, on the east side of the harbour, not unlike singing of psalms. I was told that the like had been heard at the same time every morning, but it never came to my knowledge till now, when it was too late to learn the occasion of it. Some were of opinion, that at the east point of the harbour (where we observed, in coming in, some houses, boats, etc.) was something sacred to religion, because some of our people had attempted to go to this point, and were prevented by the natives. I thought, and do still think, it was owing to a desire they shewed on every occasion, of fixing bounds to our excursions. So far as we had once been, we might go again; but not farther with their consent. But by encroaching a little every time, our country expeditions were insensibly extended without giving the least umbrage. Besides, these

morning ceremonies, whether religious or not, were not performed down at that point, but in a part where some of our people had been daily.

I cannot say what might be the true cause of these people shewing such dislike to our going up into their country. It might be owing to a naturally jealous disposition, or perhaps to their being accustomed to hostile visits from their neighbours, or quarrels among themselves. Circumstances seemed to shew that such must frequently happen; for we observed them very expert in arms, and well accustomed to them; seldom or never travelling without them. It is possible all this might be on our account; but I hardly think it. We never gave them the least molestation, nor did we touch any part of their property, not even the wood and water, without first having obtained their consent. The very cocoa-nuts, hanging over the heads of the workmen, were as safe as those in the middle of the island. It happened rather fortunately, that there were so many cocoa-nut trees, near the skirts of the harbour, which seemed not to be private property; so that we could generally prevail on the natives to bring us some of these nuts, when nothing would induce them to bring any out of the country.

We were not wholly without refreshments; for besides the fish, which our seine now and then provided us with, we procured daily some fruits or roots from the natives, though but little in proportion to what we could consume. The reason why we got no more might be our having nothing to give them in exchange, which they thought valuable. They had not the least knowledge of iron; consequently, nails and iron tools, beads, etc. which had so great a run at the more eastern isles, were of no consideration here; and cloth can be of no use to people who go naked.

The produce of this island is bread-fruit, plantains, cocoa-nuts, a fruit like a nectarine, yams, tarra, a sort of potatoe, sugar-cane, wild figs, a fruit like an orange, which is not eatable, and some other fruit and nuts whose names I have not. Nor have I any doubt that the nutmeg before mentioned was the produce of this island. The bread-fruit, cocoa-nuts, and plantains, are neither so plentiful nor so good as at Otaheite; on the other hand, sugar-canes and yams are not only in greater plenty, but of superior quality, and much larger. We got one of the latter which weighed fifty-six pounds, every ounce of which was good. Hogs did not seem to be scarce; but we saw not many fowls. These are the only domestic animals they have. Land-birds are not more numerous than at Otaheite, and the other islands; but we met with some small birds, with a very beautiful plumage, which we had never seen before. There is as great a variety of trees and plants here, as at any island we touched at, where our botanists had time to examine. I believe these people live chiefly on the produce of the land, and that the sea contributes but little to their subsistence. Whether this arises from the coast not abounding with fish, or from their being bad fishermen, I know not; both causes perhaps concur. I never saw any sort of fishing-tackle amongst them, nor any one out fishing, except on the shoals, or along the shores of the harbour, where they would watch to strike with a dart such fish as came within their reach; and in this they were expert. They seemed much to admire our catching fish with the seine; and, I believe, were not well pleased with it at last. I doubt not, they have other methods of catching fish besides striking them.

We understood that the little isle of Immer was chiefly inhabited by fishermen, and that the canoes we frequently saw pass, to and from that isle and the east point of the harbour, were fishing canoes. These canoes were of unequal sizes, some thirty feet long, two broad, and three deep; and they are composed of several pieces of wood clumsily sewed together with bandages. The joints are covered on the outside by a thin batten champered off at the edges, over which the bandages pass. They are navigated either by paddles or sails. The sail is lateen, extended to a yard and boom, and hoisted to a short mast. Some of the large canoes have two sails, and all of them outriggers.

At first we thought the people of this island, as well as those of Erromango, were a race between the natives of the Friendly Islands and those of Mallicollo; but a little acquaintance with them convinced us that they had little or no affinity to either, except it be in their hair, which is much like what the people of the latter island have. The general colours of it are black and brown, growing to a tolerable length, and very crisp and curly. They separate it into small locks, which they would or cue round with the rind of a slender plant, down to about an inch of the ends; and, as the hair grows, the woolding is continued. Each of these cues or locks is somewhat thicker than common whipcord; and they look like a parcel of small strings hanging down from the crown of their heads. Their beards, which are strong and bushy, are generally short. The women do not wear their hair so, but cropped; nor do the boys, till they approach manhood. Some few men, women, and children, were seen, who had hair like ours; but it was obvious that these were of another nation; and, I think, we understood they came from Erronan. It is to this island they ascribe one of the two languages which they speak, and which is nearly, if not exactly, the same as that spoken in the Friendly Islands. It is therefore more than probable that Erronan was peopled from that nation, and that by long intercourse with Tanna and the other neighbouring islands, each had learnt the other's language, which they use indiscriminately.

The other language which the people of Tanna speak, and, as we understood, those of Erromango and Annatom, is properly their own. It is different from any we had before met with, and bears no affinity to that of Mallicollo; so that, it should seem, the people of these islands are a distinct nation of themselves. Mallicollo, Apee, etc. were names entirely

unknown to them; they even knew nothing of Sandwich Island, which is much nearer. I took no small pains to know how far their geographical knowledge extended; and did not find that it exceeded the limits of their horizon.

These people are of the middle size, rather slender than otherwise; many are little, but few tall or stout; the most of them have good features, and agreeable countenances; are, like all the tropical race, active and nimble; and seem to excel in the use of arms, but not to be fond of labour. They never would put a hand to assist in any work we were carrying on, which the people of the other islands used to delight in. But what I judge most from, is their making the females do the most laborious work, as if they were pack-horses. I have seen a woman carrying a large bundle on her back, or a child on her back and a bundle under her arm, and a fellow strutting before her with nothing but a club or spear, or some such thing. We have frequently observed little troops of women pass, to and fro, along the beach, laden with fruit and roots, escorted by a party of men under arms; though, now and then, we have seen a man carry a burden at the same time, but not often. I know not on what account this was done, nor that an armed troop was necessary. At first, we thought they were moving out of the neighbourhood with their effects, but we afterwards saw them both carry out, and bring in, every day.

I cannot say the women are beauties, but I think them handsome enough for the men, and too handsome for the use that is made of them. Both sexes are of a very dark colour, but not black; nor have they the least characteristic of the negro about them. They make themselves blacker than they really are, by painting their faces with a pigment of the colour of black-lead. They also use another sort which is red, and a third sort brown, or a colour between red and black. All these, but especially the first, they lay on with a liberal hand, not only on the face, but on the neck, shoulders, and breast. The men wear nothing but a belt, and the wrapping leaf as at Mallicollo. The women have a kind of petticoat made of the filaments of the plantain-tree, flags, or some such thing, which reaches below the knee. Both sexes wear ornaments, such as bracelets, ear-rings, necklaces, and amulets. The bracelets are chiefly worn by the men; some made of sea-shells, and others of those of the cocoa-nut. The men also wear amulets; and those of most value being made of a greenish stone, the green stone of New Zealand is valued by them for this purpose. Necklaces are chiefly used by the women, and made mostly of shells. Ear-rings are common to both sexes, and those valued most are made of tortoise-shell. Some of our people having got some at the Friendly Islands, brought it to a good market here, where it was of more value than any thing we had besides; from which I conclude that these people catch but few turtle, though I saw one in the harbour, just as we were getting under sail. I observed that, towards the latter end of our stay, they began to ask for hatchets, and large nails, so that it is likely they had found that iron is more serviceable than stone, bone, or shells, of which all their tools I have seen are made. Their stone hatchets, at least all those I saw, are not in the shape of adzes, as at the other islands, but more like an axe. In the helve, which is pretty thick, is made a hole into which the stone is fixed.

These people, besides the cultivation of ground, have few other arts worth mentioning. They know how to make a coarse kind of matting, and a coarse cloth of the bark of a tree, which is used chiefly for belts. The workmanship of their canoes, I have before observed, is very rude; and their arms, with which they take the most pains in point of neatness, come far short of some others we have seen. Their weapons are clubs, spears or darts, bows and arrows, and stones. The clubs are of three or four kinds, and from three to five feet long. They seem to place most dependence on the darts, which are pointed with three bearded edges. In throwing them they make use of a becket, that is, a piece of stiff plaited cord about six inches long, with an eye in one end and a knot at the other. The eye is fixed on the fore-finger of the right hand, and the other end is hitched round the dart, where it is nearly on an equipoise. They hold the dart between the thumb and remaining fingers, which serve only to give it direction, the velocity being communicated by the becket and fore-finger. The former flies off from the dart the instant its velocity becomes greater than that of the hand. But it remains on the finger ready to be used again. With darts they kill both birds and fish, and are sure of hitting a mark, within the compass of the crown of a hat, at the distance of eight or ten yards; but, at double that distance, it is chance if they hit a mark the size of a man's body, though they will throw the weapon sixty or seventy yards. They always throw with all their might, let the distance be what it will. Darts, bows and arrows are to them what musquets are to us. The arrows are made of reeds pointed with hard wood; some are bearded and some not, and those for shooting birds have two, three, and sometimes four points. The stones they use are, in general, the branches of coral rocks from eight to fourteen inches long, and from an inch to an inch-and-half in diameter. I know not if they employ them as missive weapons; almost every one of them carries a club, and besides that, either darts, or a bow and arrows, but never both; those who had stones kept them generally in their belts.

I cannot conclude this account of their arms without adding an entire passage out of Mr Wales's journal. As this gentleman was continually on shore amongst them, he had a better opportunity of seeing what they could perform, than any of us. The passage is as follows: "I must confess I have been often led to think the feats which Homer represents his heroes as performing with their spears, a little too much of the marvellous to be admitted into an heroic poem; I mean when confined within the strait stays of Aristotle. Nay, even so great an advocate for him as Mr Pope, acknowledges them to be *surprising*. But since I have seen what these people can do with their wooden spears, and

them badly pointed, and not of a very hard nature, I have not the least exception to any one passage in that great poet on this account. But, if I see fewer exceptions, I can find infinitely more beauties in him; as he has, I think, scarce an action, circumstance, or description of any kind whatever, relating to a spear, which I have not seen and recognised among these people; as their whirling motion, and whistling noise, as they fly; their quivering motion, as they stick in the ground when they fall; their meditating their aim, when they are going to throw, and their shaking them in their hand as they go along, etc. etc."

I know no more of their cookery, than that it consists of roasting and baking; for they have no vessel in which water can be boiled. Nor do I know that they have any other liquor but water and the juice of the cocoa-nut.

We are utter strangers to their religion; and but little acquainted with their government. They seem to have chiefs among them; at least some were pointed out to us by that title; but, as I before observed, they appeared to have very little authority over the rest of the people. Old Geogy was the only one the people were ever seen to take the least notice of; but whether this was owing to high rank or old age, I cannot say. On several occasions I have seen the old men respected and obeyed. Our friend Paowang was so; and yet I never heard him called chief, and have many reasons to believe that he had not a right to any more authority than many of his neighbours, and few, if any, were bound to obey him, or any other person in our neighbourhood; for if there had been such a one, we certainly should, by some means, have known it. I named the harbour Port Resolution, after the ship, she being the first which ever entered it. It is situated on the north side of the most eastern point of the island, and about E.N.E. from the volcano; in the latitude of 19deg 32' 25" 1/2 S., and in the longitude of 169deg 44' 35" E. It is no more than a little creek running in S. by W. 1/2 W. three quarters of a mile, and is about half that in breadth. A shoal of sand and rocks, lying on the east side, makes it still narrower. The depth of water in the harbour is from six to three fathoms, and the bottom is sand and mud. No place can be more convenient for taking in wood and water; for both are close to the shore. The water stunk a little after it had been a few days on board, but it afterwards turned sweet; and even when it was at the worst, the tin machine would, in a few hours, recover a whole cask. This is an excellent contrivance for sweetening water at sea, and is well known in the navy.

Mr Wales, from whom I had the latitude and longitude, found the variation of the needle to be 7deg 14' 12" E., and the dip of its south end 45deg 2' 3/4. He also observed the time of high water, on the full and change days, to be about 5h 45m; and the tide to rise and fall three feet.

CHAPTER VII.

The Survey of the Islands continued, and a more particular Description of them.

1774 August

As soon as the boats were hoisted in, we made sail, and stretched to the eastward, with a fresh gale at S.E., in order to have a nearer view of Errovan, and to see if there was any land in its neighbourhood. We stood on till midnight, when, having passed the island, we tacked, and spent the remainder of the night making two boards. At sun-rise on the 21st, we stood S.W., in order to get to the south of Tanna, and nearer to Annatom, to observe if any more land lay in that direction; for an extraordinary clear morning had produced no discovery of any to the east. At noon, having observed in latitude 20deg 33' 30", the situation of the lands around us was as follows: Port Resolution bore north 86deg W., distant six and a half leagues; the island of Tanna extended from S. 88deg W., to N. 64deg W.; Traitor's Head N. 58deg W., distant twenty leagues; the island of Errovan N. 80deg E., distant five leagues; and Annatom from S. 1/2 E. to S. 1/2 W., distant ten leagues. We continued to stretch to the south till two o'clock p.m. when, seeing no more land before us, we bore up round the S.E. end of Tanna; and, with a fine gale at E.S.E., ran along the south coast at one league from shore. It seemed a bold one, without the guard of any rocks; and the country full as fertile as in the neighbourhood of the harbour, and making a fine appearance. At six o'clock the high land of Erromango appeared over the west end of Tanna in the direction of 10deg W.; at eight o'clock we were past the island, and steered N.N.W. for Sandwich Island, in order to finish the survey* of it, and of the isles to the N.W. On the 22d, at four o'clock p.m., we drew near the S.E. end, and ranging the south coast, found it to trend in the direction of W. and W.N.W. for about nine leagues. Near the middle of this length, and close to the shore, are three or four small isles, behind which seemed to be a safe anchorage. But not thinking I had any time to spare to visit this fine island, I continued to range the coast to its western extremity, and then steered N.N.W. from the S.E. end of Mallicollo, which, at half past six o'clock next morning, bore N. 14deg E., distant seven or eight leagues, and Three-Hills Island S. 82deg E. Soon after, we saw the islands Apee, Paom, and Ambrym. What we had comprehended under the name of Paom appeared now to be two isles, something like a separation being seen between the hill and the land to the west of it. We approached the S.W. side of Mallicollo to within half a league, and ranged it at that distance. From the S.E. point, the direction of the land is west, a little southerly, for six or seven leagues, and then N.W. by W. three leagues, to a pretty high point or head-land, situated in

latitude 16deg 29', and which obtained the name of South-west Cape. The coast, which is low, seemed to be indented into creeks and projecting points; or else, these points were small isles lying under the shore. We were sure of one, which lies between two and three leagues east of the Cape. Close to the west side or point of the Cape, lies, connected with it by breakers, a round rock or islet, which helps to shelter a fine bay, formed by an elbow in the coast, from the reigning winds.

[* The word Survey is not here to be understood in its literal sense. Surveying a place, according to my idea, is taking a geometrical plan of it, in which every place is to have its true situation, which cannot be done in a work of this nature.]

The natives appeared in troops on many parts of the shore, and some seemed desirous to come off to us in canoes, but they did not; and, probably, our not shortening sail, was the reason. From the South-west Cape, the direction of the coast is N. by W.; but the most advanced land bore from it N.W. by N., at which the land seemed to terminate. Continuing to follow the direction of the coast, at noon it was two miles from us; and our latitude, by observation, was 16deg 22' 30" S. This is nearly the parallel to Port Sandwich, and our never-failing guide, the watch, shewed that we were 26' west of it; a distance which the breadth of Mallicollo cannot exceed in this parallel. The South-east Cape bore S. 26deg E., distant seven miles; and the most advanced point of land, for which we steered, bore N.W. by N. At three o'clock, we were the length of it, and found the land continued, and trending more and more to the north. We coasted it to its northern extremity, which we did not reach till after dark, at which time we were near enough to the shore to hear the voices of people, who were assembled round a fire they had made on the beach. There we sounded, and found twenty fathoms and a bottom of sand; but, on edging off from the shore, we soon got out of sounding, and then made a trip back to the south till the moon got up. After this we stood again to the north, hauled round the point, and spent the night in Bougainville's passage; being assured of our situation before sun-set, by seeing the land, on the north side of the passage, extending as far as N.W. 1/2 W.

The south coast of Mallicollo, from the S.E. end to the S.W. Cape, is luxuriantly clothed with wood, and other productions of nature, from the sea-shore to the very summits of the hills. To the N.W. of the Cape the country is less woody, but more agreeably interspersed with lawns, some of which appeared to be cultivated. The summits of the hills seemed barren; and the highest lies between Port Sandwich and the S.W. Cape. Farther north the land falls insensibly lower, and is less covered with wood. I believe it is a very fertile island, and well inhabited; for we saw smoke by day and fire by night, in all parts of it.

Next morning at sun-rise, we found ourselves nearly in the middle of the passage, the N.W. end of Mallicollo extending from S. 30deg E., to S. 58deg W.; the land to the north from N. 70deg W. to N. 4deg E.; and the Isle of Lepers bearing N. 30deg E., distant eleven or twelve leagues. We now made sail, and steered N. by E., and afterwards north, along the east coast of the northern land, with a fine breeze at S.E. We found that this coast, which at first appeared to be continued, was composed of several low woody isles, the most of them of small extent, except the southernmost, which, on account of the day, I named St Bartholomew. It is six or seven leagues in circuit, and makes the N.E. point of Bougainville's Passage. At noon the breeze began to slacken. We were at this time between two and three miles from the land, and observed in latitude 15deg 23' the Isle of Lepers bearing from E. by N. to S., distance seven leagues; and a high bluff-head, at which the coast we were upon seemed to terminate, N.N.W. 1/2 W., distant ten or eleven leagues; but from the mast-head we could see land to the east. This we judged to be an island, and it bore N. by W. 1/2 W.

As we advanced to N.N.W., along a fine coast covered with woods, we perceived low land that extended off from the bluff-head towards the island above mentioned, but did not seem to join it. It was my intention to have gone through the channel, but the approach of night made me lay it aside, and steer without the island. During the afternoon, we passed some small isles lying under the shore; and observed some projecting points of unequal height, but were not able to determine whether or no they were connected with the main land. Behind them was a ridge of hills which terminated at the bluff-head. There were cliffs, in some places of the coast, and white patches, which we judged to be chalk. At ten o'clock, being the length of the isle which lies off the head, we shortened sail, and spent the night in making short boards.

At day-break on the 25th, we were on the north side of the island (which is of a moderate height, and three leagues in circuit,) and steered west for the bluff-head, along the low land under it. At sun-rise an elevated coast came in sight beyond the bluff-head, extending to the north as far N.W. by W. After doubling the head we found the land to trend south, a little easterly, and to form a large deep bay, bounded on the west by the coast just mentioned.

Every thing conspired to make us believe this was the Bay of St Philip and St Jago, discovered by Quiros in 1606. To determine this point, it was necessary to proceed farther up; for at this time we saw no end to it. The wind being at south, we were obliged to ply, and first stretched over for the west shore, from which we were three miles at noon, when our latitude was 14deg 55' 30" S., longitude 167deg 3' E.; the mouth of the bay extending from N. 64deg W., to S.

86deg E., which last direction was the bluff-head, distant three leagues. In the afternoon the wind veering to E.S.E., we could look up to the head of the bay; but as the breeze was faint, a N.E. swell hurtled us over to the west shore; so that, at half past four o'clock p.m., we were no more than two miles from it, and tacked in one hundred and twenty fathoms water, a soft muddy bottom. The bluff-head, or east point of the bay, bore north 53deg east.

We had no sooner tacked than it fell calm, and we were left to the mercy of the swell, which continued to hurtle us towards the shore, where large troops of people were assembled. Some ventured off in two canoes; but all the signs of friendship we could make, did not induce them to come along-side, or near enough to receive any present from us. At last they took sudden fright at something, and returned ashore. They were naked, except having some long grass, like flags, fastened to a belt, and hanging down before and behind, nearly as low as the knee. Their colour was very dark, and their hair woolly, or cut short, which made it seem so. The canoes were small and had outriggers. The calm continued till near eight o'clock, in which time we drove into eighty-five fathoms water, and so near the shore that I expected we should be obliged to anchor. A breeze of wind sprung up at E.S.E., and first took us on the wrong side; but, contrary to all our expectations, and when we had hardly room to veer, the ship came about, and having filled on the starboard tack, we stood off N.E. Thus we were relieved from the apprehensions of being forced to anchor in a great depth, on a lee shore, and in a dark and obscure night.

We continued to ply upwards, with variable light breezes between E.S.E. and S., till ten next morning, when it fell calm. We were, at this time, about seven or eight miles from the head of the bay, which is terminated by a low beach; and behind that, is an extensive flat covered with wood, and bounded on each side by a ridge of mountains. At noon we found the latitude to be 15deg 5' S., and were detained here by the calm till one o'clock p.m., when we got a breeze at N. by W., with which we steered up to within two miles of the head of the bay; and then I sent Mr Cooper and Mr Gilbert to sound and reconnoitre the coast, while we stood to and fro with the ship. This gave time to three sailing canoes which had been following us some time, to come up. There were five or six men in each; and they approached near enough to receive such things as were thrown to them fastened to a rope, but would not advance alongside. They were the same sort of people as those we had seen the preceding evening; indeed we thought they came from the same place. They seemed to be stouter and better shaped men than those of Mallicollo; and several circumstances concurred to make us think they were of another nation. They named the numerals as far as five or six in the language of Anamocka, and understood us when we asked the names of the adjacent lands in that language. Some, indeed, had black short frizzled hair like the natives of Mallicollo, but others had it long, tied up on the crown of the head, and ornamented with feathers like the New Zealanders. Their other ornaments were bracelets and necklaces; one man had something like a white shell on his forehead, and some were painted with a blackish pigment. I did not see that they had any other weapon but darts and gigs, intended only for striking of fish. Their canoes were much like those of Tanna, and navigated in the same manner, or nearly so. They readily gave us the names of such parts as we pointed to; but we could not obtain from them the name of the island. At length, seeing our boats coming, they paddled in for the shore, notwithstanding all we could say or do to detain them.

When the boats returned, Mr Cooper informed me, that they had landed on the beach which is at the head of the bay, near a fine river, or stream of fresh water, so large and deep that they judged boats might enter it at high water. They found three fathoms depth close to the beach, and fifty-five and fifty, two cables' length off. Farther out they did not sound; and where we were with the ship, we had no soundings with a hundred and seventy fathoms line. Before the boats got on board, the wind had shifted to the S.S.E. As we were in want of nothing, and had no time to spare, I took the advantage of this shift of wind, and steered down the bay. During the fore-part of the night, the country was illuminated with fires, from the sea-shore to the summits of the mountains; but this was only on the west side of the shore. I cannot pretend to say what was the occasion of these fires, but have no idea of their being on our account. Probably, they were burning or clearing the ground for new plantations. At day-break on the 27th, we found ourselves two-thirds down the bay, and, as we had but little wind, it was noon before we were the length of the N.W. point, which at this time bore N. 82deg W., distant five miles. Latitude observed 14deg 39' 30".

Some of our gentlemen were doubtful of this being the bay of St Philip and St Jago, as there was no place which they thought could mean the port of Vera Cruz. For my part I found general points to agree so well with Quiros's description, that I had not the least doubt about it. As to what he calls the Port of Vera Cruz, I understand that to be the anchorage at the head of the bay, which in some places may extend farther off than where our boats landed. There is nothing in his account of the port which contradicts this supposition*. It was but natural for his people to give a name to the place, independent of so large a bay, where they lay so long at anchor. A port is a vague term, like many others in geography, and has been very often applied to places far less sheltered than this.

[See Quiros's Voyage, in Dalrymple's Collection, vol i, p.136, 137.]

Our officers observed that grass and other plants grew on the beach close to high water-mark, which is always a sure

sign of pacific anchorage, and an undeniable proof that there never is a great surf on the shore. They judged that the tide rose about four or five feet, and that boats and such craft might, at high-water, enter the river, which seemed to be pretty deep and broad within; so that this, probably, is one of those mentioned by Quiros; and if we were not deceived, we saw the other.

The bay hath twenty leagues sea-coast, six on the east side, which lies in the direction of S. half W. and N. half E., two at the head, and twelve on the west side, the direction of which is S. by E. and N. by W., from the head down to two-thirds of its length, and then N.W. by N. to the N.W. point. The two points which form the entrance, lie in the direction of S. 53deg E., and N. 53deg W., from each other, distant ten leagues. The bay is every where free from danger, and of an unfathomable depth, except near the shores, which are for the most part low. This, however, is only a very narrow strip between the sea-shore and the foot of the hills; for the bay, as well as the flat land at the head of it, is bounded on each side by a ridge of hills, one of which, that to the west, is very high and double, extending the whole length of the island. An uncommonly luxuriant vegetation was every where to be seen; the sides of the hills were chequered with plantations; and every valley watered by a stream. Of all the productions of nature this country was adorned with, the cocoa-nut trees were the most conspicuous. The columns of smoke we saw by day, and fires by night all over the country, led us to believe that it is well inhabited and very fertile. The east point of this bay, which I name Cape Quiros, in memory of its first discoverer, is situated in latitude 14deg 56' S., longitude 167deg 13' E. The N.W. point, which I named Cape Cumberland, in honour of his Royal Highness the Duke, lies in the latitude of 14deg 38' 45" S., longitude 166deg 49' 1/2 E., and is the N.W. extremity of this archipelago; for, after doubling it, we found the coast to trend gradually round to the S. and S.S.E.

On the 28th and 29th, we had light airs and calms, so that we advanced but little. In this time, we took every opportunity, when the horizon was clearer than usual, to look out for more land, but none was seen. By Quiros's track to the north, after leaving the bay above-mentioned, it seems probable that there is none nearer than Queen Charlotte's Island, discovered by Captain Carteret, which lies about ninety leagues N.N.W. from Cape Cumberland, and I take to be the same with Quiros's Santa Cruz.

On the 30th, the calm was succeeded by a fresh breeze at S.S.E. which enabled us to ply up the coast. At noon we observed in 15deg 20'; afterwards we stretched in east, to within a mile of the shore, and then tacked in seventy-five fathoms, before a sandy flat, on which several of the natives made their appearance. We observed on the sides of the hills, several plantations that were laid out by line, and fenced round.

On the 31st, at noon, the S. or S.W. point of the island bore N. 62deg E., distant four leagues. This forms the N.W. point of what I call Bougainville's Passage; the N.E. point at this time bore N. 85deg E., and the N.W. end of Mallicollo from S. 54deg E. to S. 72deg E. Latitude observed 15deg 45' S. In the afternoon, in stretching to the east, we weathered the S.S.W. point of the island, from which the coast trends east, northerly. It is low, and seemed to form some creeks or coves; and, as we got farther into the passage, we perceived some small low isles lying along it, which seemed to extend behind St Bartholomew Island.

Having now finished the survey of the whole archipelago, the season of the year made it necessary for me to return to the south, while I had yet some time left to explore any land I might meet with between this and New Zealand; where I intended to touch, that I might refresh my people, and recruit our stock of wood and water for another southern course. With this view, at five p.m. we tacked, and hauled to the southward with a fresh gale at S.E. At this time the N.W. point of the passage, or the S.W. point of the island Tierra del Espiritu Santo, the only remains of Quiros's continent, bore N. 82deg W., distant three leagues. I named it Cape Lisburne, and its situation is in latitude 15deg 40', longitude 165deg 59' E.

The foregoing account of these islands, in the order in which we explored them, not being particular enough either as to situation or description, it may not be improper now to give a more accurate view of them, which will convey to the reader a better idea of the whole groupe.

The northern islands of this archipelago were first discovered by that great navigator Quiros in 1606; and, not without reason, were considered as part of the southern continent, which, at that time, and until very lately, was supposed to exist. They were next visited by M. de Bougainville, in 1768; who, besides landing on the Isle of Lepers, did no more than discover that the land was not connected, but composed of islands, which he called the Great Cyclades. But as, besides ascertaining the extent and situation of these islands, we added to them several new ones which were not known before, and explored the whole, I think we have obtained a right to name them; and shall in future distinguish them by the name of the New Hebrides. They are situated between the latitude of 14deg 29' and 20deg 4' S., and between 166deg 41' and 170deg 21' E. longitude, and extend an hundred and twenty-five leagues in the direction of N.N.W. 1/2 W. and S.S.E. 1/2 E.

The most northern island is that called by M. de Bougainville, Peak of the Etoile; it is situated, according to his account, in latitude, 14deg 29', longitude 168deg 9'; and N. by W., eight leagues from Aurora.

The next island, which lies farthest north, is that of Tierra del Espiritu Santo. It is the most western and largest of all the Hebrides, being twenty-two leagues long, in the direction of N.N.W. 1/2 W. and S.S.E. 1/2 E., twelve in breadth, and sixty in circuit. We have obtained the true figure of this island very accurately. The land of it, especially the west side, is exceedingly high and mountainous; and, in many places the hills rise directly from the sea. Except the cliffs and beaches, every other part is covered with wood, or laid out in plantations. Besides the bay of St Philip and St Jago, the isles which lie along the south and east coast, cannot, in my opinion, fail of forming some good bays or harbours.

The next considerable island is that of Mallicollo. To the S.E. it extends N.W. and S.E., and is eighteen leagues long in that direction. Its greatest breadth, which is at the S.E. end, is eight leagues. The N.W. end is two-thirds this breadth, and near the middle, one-third. This contraction is occasioned by a wide and pretty deep bay on the S.W. side. To judge of this island from what we saw of it, it must be very fertile and well inhabited. The land on the sea-coast is rather low, and lies with a gentle slope from the hills which are in the middle of the island. Two-thirds of the N.E. coast was only seen at a great distance; therefore the delineations of it can have no pretensions to accuracy; but the other parts, I apprehend, are without any material errors.

St Bartholomew lies between the S.E. end of Tierra del Espiritu Santo, and the north end of Mallicollo; and the distance between it and the latter is eight miles. This is the passage through which M. de Bougainville went; and the middle of it is in latitude 15deg 48'.

The Isle of Lepers lies between Espiritu Santo and Aurora Island, eight leagues from the former, and three from the latter, in latitude 15deg 22', and nearly under the same meridian as the S.E. end of Mallicollo. It is of an egg-like figure, very high, and eighteen or twenty leagues in circuit. Its limits were determined by several bearings; but the lines of the shore were traced out by guess, except the N.E. part where there is anchorage half a mile from the land.

Aurora, Whitsuntide, Ambrym, Paoom, and its neighbour Apee, Threehills, and Sandwich Islands, lie all nearly under the meridian of 167deg 29' or 30' E., extending from the latitude of 14deg 51' 30", to 17deg 53' 30".

The island of Aurora lies N. by W. and S. by E., and is eleven leagues long in that direction; but I believe, it hardly any where exceeds two or two and a half in breadth. It hath a good height, its surface hilly, and every where covered with wood, except where the natives have their dwellings and plantations.

Whitsuntide Isle, which is one league and a half to the south of Aurora, is of the same length, and lies in the direction of north and south, but is something broader than Aurora Island. It is considerably high, and clothed with wood, except such parts as seemed to be cultivated, which were pretty numerous.

From the south end of Whitsuntide Island to the north side of Ambrym is two leagues and a half. This is about seventeen leagues in circuit; its shores are rather low, but the land rises with an unequal ascent to a tolerably high mountain in the middle of the island, from which ascended great columns of smoke; but we were not able to determine whether this was occasioned by a volcano or not. That it is fertile and well inhabited, seems probable from the quantities of smoke which we saw rise out of the woods, in such parts of the island as came within the compass of our sight; for it must be observed, that we did not see the whole of it.

We saw still much less of Paoom and its neighbourhood. I can say no more of this island than that it towers up to a great height in the form of a round hay-stack; and the extent of it, and of the adjoining isle (if there are two), cannot exceed three or four leagues in any direction; for the distance between Ambrym and Apee is hardly five; and they lie in this space, and east from Port Sandwich, distant about seven or eight leagues.

The island of Apee is not less than twenty leagues in circuit; its longest direction is about eight leagues N.W. and S.E.; it is of considerable height; and hath a hilly surface diversified with woods and lawns, the west and south parts especially; for the others we did not see.

Shepherd's Isles are a group of small ones of unequal size, extending off from the S.E. point of Apee about five leagues in the direction of S.E.

The island Threehills lies south four leagues from the coast of Apee, and S.E. 1/2 S., distant seventeen leagues from Port Sandwich; to this, and what hath been already said of it, I shall only add, that W. by N., five miles from the west point, is a reef of rocks on which the sea continually breaks.

Nine leagues, in the direction of south, from Threehills, lies Sandwich Island. Twohills, the Monument, and Montagu Islands, lie to the east of this line, and Hinchinbrook to the west, as also two or three small isles which lie between it and Sandwich Island, to which they are connected by breakers.

Sandwich Island is twenty-five leagues in circuit; its greatest extent is ten leagues; and it lies in the direction of N.W. by W. and S.E. by E. The N.W. coast of this island we only viewed at a distance; therefore our chart of this part may be faulty so far as it regards the line of the coast, but no farther. The distance from the south end of Mallicollo to the N.W. end of Sandwich Island, is twenty-two leagues in the direction of S.S.E. 1/2 E.

In the same direction lie Erromango, Tanna, and Annatom. The first is eighteen leagues from Sandwich Island, and is twenty-four or twenty-five leagues in circuit. The middle of it lies in the latitude of 18deg 54', longitude 169deg 19' E., and it is of a good height, as may be gathered from the distance we were off when we first saw it.

Tanna lies six leagues from the south side of Erromango, extending S.E. by S. and N.W. by N., about eight leagues long in that direction, and every where about three or four leagues broad.

The isle of Immer lies in the direction of N. by E. 1/2 E., four leagues from Port Resolution in Tanna; and the island of Erronan or Footoona East, in the same direction, distant eleven leagues. This, which is the most eastern island of all the Hebrides, did not appear to be above five leagues in circuit, but is of a considerable height and flat at top. On the N.E. side is a little peak seemingly disjointed from the isle; but we thought it was connected by low land. Annatom, which is the southernmost island, is situated in the latitude of 20deg 3', longitude 170deg 4', and S. 30deg E., eleven or twelve leagues from Port Resolution. It is of a good height, with an hilly surface; and more I must not say of it.

Here follow the lunar observations by Mr Wales, for ascertaining the longitude of these islands, reduced by the watch to Port Sandwich in Mallicollo, and Port Resolution in Tanna.

Port Sandwich, (Mean of 10 sets of ob. before 167deg 56' 33" 1/4) E.

(2 ditto, at 168 2 37 1/2) long

(20 ditto, after 167 52 57)

(-----

(Mean of those means, 167 57 22 3/4

Port Resolution, (Mean of 20 sets of ob. before 169 37 35) E.

(5 ditto, at 169 48 48) long

(20 ditto, after 169 47 22 1/2)

(-----

(Mean of these means, 169 44 33

It is necessary to observe, that each set of observations, consisting of between six and ten observed distances of the sun and moon, or moon and stars, the whole number amounts to several hundreds; and these have been reduced by means of the watch to all the islands; so that the longitude of each is as well ascertained as that of the two ports above-mentioned. As a proof of this I shall only observe, that the longitude of the two ports, as pointed out by the watch and by the observations, did not differ two miles. This also shews what degree of accuracy these observations are capable of, when multiplied to a considerable number, made with different instruments, and with the sun and stars, or both sides of the moon. By this last method, the errors which may be either in the instruments or lunar tables, destroy one another, and likewise those which may arise from the observer himself; for some men may observe closer than others. If we consider the number of observations that may be obtained in the course of a month (if the weather is favourable,) we shall perhaps find this method of finding the longitude of places as accurate as most others; at least it is the most easy, and attended with the least expence to the observer. Every ship that goes to foreign parts is, or maybe, supplied with a sufficient number of quadrants at a small expence; I mean good ones, proper for making these observations. For the difference of the price between a good and a bad one, I apprehend, can never be an object with an officer. The most expensive article, and what is in some measure necessary in order to arrive at the utmost accuracy, is a good watch; but for common use, and where that strict accuracy is not required, this may be dispensed with. I have observed before, in this journal, that this method of finding the longitude is not so difficult but that any man, with proper application, and a little practice, may soon learn to make these observations as well as the astronomers themselves. I have seldom known any material difference between the observations made by Mr Wales, and those made by the officers at the same time*.

[See Vol I. p40. "Which is nearly the same difference as the day before..."]

In observing the variation of the magnetic needle, we found, as usual, our compasses differ among themselves,

sometimes near 2deg; the same compass too, would sometimes make nearly this difference in the variation on different days, and even between the morning and evening of the same day, when our change of situation has been but very little. By the mean of the observations which I made about Erromango; and the S.E. part of these islands, the variation of the compass was 10deg 5' 48" E.; and the mean of those made about Tierra del Espiritu Santo, gave 10deg 5' 30" E. This is considerably more than Mr Wales found it to be at Tanna. I cannot say what might occasion this difference in the variation observed at sea and on shore, unless it be influenced by the land; for I must give the preference to that found at sea, as it is agreeable to what we observed before we made the islands, and after we left them.

CHAPTER VIII.

An Account of the Discovery of New Caledonia, and the Incidents that happened while the Ship lay in Balade.

1774 September

At sun-rise on the 1st of September, after having stood to S.W. all night, no more land was to be seen. The wind remaining in the S.E. quarter, we continued to stand to S.W. On the 2d, at five o'clock, p.m., being in the latitude 18deg 22', longitude 165deg 26', the variation was 10deg 50' E.; and at the same hour on the 3d, it was 10deg 51', latitude at that time 19deg 14', longitude 165deg E. The next morning, in the latitude of 19deg 49' longitude 164deg 53", the amplitude gave 10deg 21', and the azimuths 10deg 7' E. At eight o'clock, as we were steering to the south, land was discovered bearing S.S.W., and at noon it extended from S.S.E. to W. by S., distant about six leagues. We continued to steer for it with a light breeze at east, till five in the evening, when we were stopped by a calm. At this time we were three leagues from the land, which extended from S.E. by S. to W. by N., round by the S.W. Some openings appeared in the west, so that we could not tell whether it was one connected land or a group of islands. To the S.E. the coast seemed to terminate in a high promontory, which I named Cape Colnett, after one of my midshipmen who first discovered this land. Breakers were seen about half-way between us and the shore; and, behind them, two or three canoes under sail, standing out to sea, as if their design had been to come off to us; but a little before sun-set they struck their sails, and we saw them no more. After a few hours calm, we got a breeze at S.E., and spent the night standing off and on.

On the 5th, at sun-rise, the horizon being clear, we could see the coast extend to the S.E. of Cape Colnett, and round by the S.W. to N.W. by W. Some gaps or openings were yet to be seen to the west; and a reef, or breakers, seemed to lie all along the coast, connected with those we discovered the preceding night. It was a matter of indifference to me, whether we plied up the coast to the S.E., or bore down to N.W. I chose the latter; and after running two leagues down the outside of the reef (for such it proved) we came before an opening that had the appearance of a good channel, through which we might go in for the land. I wanted to get at it, not only to visit it, but also to have an opportunity to observe an eclipse of the sun which was soon to happen. With this view we brought-to, hoisted out two armed boats, and sent them to sound the channel; ten or twelve large sailing canoes being then near us. We had observed them coming off from the shore, all the morning, from different parts; and some were lying on the reef, fishing, as we supposed. As soon as they all got together, they came down to us in a body, and were pretty near when we were hoisting out our boats, which probably gave them some alarm; for, without stopping, they hauled in for the reef, and our boats followed them. We now saw that what we had taken for openings in the coast was low land, and that it was all connected, except the western extremity, which was an island known by the name of Balabea, as we afterwards learnt.

The boats having made a signal for a channel, and one of them being placed on the point of the reef on the weather side of it, we stood in with the ship, and took up the other boat in our way, when the officer informed me, that where we were to pass, was sixteen and fourteen fathoms water, a fine sandy bottom, and that having put alongside two canoes, he found the people very obliging and civil. They gave him some fish; and, in return, he presented them with medals, etc. In one was a stout robust young man, whom, they understood to be a chief. After getting within the reef, we hauled up S. 1/2 E., for a small low sandy isle that we observed lying under the shore, being followed by all the canoes. Our sounding in standing in, was from fifteen to twelve fathoms (a pretty even fine sandy bottom,) for about two miles; then we had six, five, and four fathoms. This was on the tail of a shoal which lies a little without the small isle to the N.E. Being over it, we found seven and eight fathoms water, which shallowed gradually as we approached the shore, to three fathoms, when we tacked and stood off a little, and then anchored in five fathoms, the bottom a fine sand mixed with mud. The little sandy isle bore E. by S., three-quarters of a mile distant; and we were one mile from the shore of the main, which extended from S.E. by E., round to the south, to W.N.W. The island of Balabea bore N.W. by N., and the channel, through which we came, north, four miles distant. In this situation we were extremely well sheltered from the reigning winds, by the sandy isle and its shoals, and by the shoal without them.

We had hardly got to an anchor, before we were surrounded by a great number of the natives, in sixteen or eighteen canoes, the most of whom were without any sort of weapons. At first they were shy in coming near the ship; but in a short time we prevailed on the people in one boat to get close enough to receive some presents. These we lowered

down to them by a rope, to which, in return, they tied two fish that stunk intolerably, as did those they gave us in the morning. These mutual exchanges bringing on a kind of confidence, two ventured on board the ship; and presently after, she was filled with them, and we had the company of several at dinner in the cabin. Our pease-soup, salt-beef and pork, they had no curiosity to taste; but they eat of some yams, which we happened to have yet left, calling them *Oobee*. This name is not unlike *Oofee*, as they are called at most of the islands, except Mallicollo; nevertheless, we found these people spoke a language new to us. Like all the nations we had lately seen, the men were almost naked; having hardly any other covering but such a wrapper as is used at Mallicollo*. They were curious in examining every part of the ship, which they viewed with uncommon attention. They had not the least knowledge of goats, hogs, dogs, or cats, and had not even a name for one of them. They seemed fond of large spike-nails, and pieces of red cloth, or indeed of any other colour, but red was their favourite.

[* The particular manner of applying the wrapper may be seen in Wafer's voyage, who mentions this singular custom as existing, though with some little variation, amongst the Indians of the Isthmus of Darien. See Wafer's Voyage, p. 140.]

After dinner, I went on shore with two armed boats, having with us one of the natives who had attached himself to me. We landed on a sandy beach before a vast number of people, who had got together with no other intent than to see us; for many of them had not a stick in their hands; consequently we were received with great courtesy, and with the surprise natural for people to express, at seeing men and things so new to them as we must be. I made presents to all those my friend pointed out, who were either old men, or such as seemed to be of some note; but he took not the least notice of some women who stood behind the crowd, folding my hand when I was going to give them some beads and medals. Here we found the same chief, who had been seen in one of the canoes in the morning. His name, we now learnt, was Teabooma; and we had not been on shore above ten minutes, before he called for silence. Being instantly obeyed by every individual present, he made a short speech; and soon after another chief having called for silence, made a speech also. It was pleasing to see with what attention they were heard. Their speeches were composed of short sentences; to each of which two or three old men answered, by nodding their heads, and giving a kind of grunt, significant, as I thought, of approbation. It was impossible for us to know the purport of these speeches; but we had reason to think they were favourable to us, on whose account they doubtless were made.

I kept my eyes fixed on the people all the time, and saw nothing to induce me to think otherwise. While we were with them, having enquired, by signs, for fresh water, some pointed to the east and others to the west. My friend undertook to conduct us to it, and embarked with us for that purpose. We rowed about two miles up the coast to the east, where the shore was mostly covered with mangrove-trees; and entering amongst them, by a narrow creek or river, which brought us to a little straggling village, above all the mangroves, there we landed and were shewn fresh water. The ground near this village was finely cultivated, being laid out in plantations of sugar-canes, plantains, yams, and other roots, and watered by little rills, conducted by art from the main stream, whose source was in the hills. Here were some cocoa-nut trees, which did not seem burdened with fruit. We heard the crowing of cocks, but saw none. Some roots were baking on a fire in an earthen jar, which would have held six or eight gallons; nor did we doubt its being their own manufacture. As we proceeded up the creek, Mr Forster having shot a duck flying over our heads, which was the first use these people saw made of our fire-arms, my friend begged to have it; and when he landed, told his countrymen in what manner it was killed. The day being far spent, and the tide not permitting us to stay longer in the creek, we took leave of the people and got on board a little after sun-set. From this little excursion, I found that we were to expect nothing from these people but the privilege of visiting their country undisturbed. For it was easy to see they had little else than good-nature to bestow. In this they exceeded all the nations we had yet met with; and, although it did not satisfy the demands of nature, it at once pleased and left our minds at ease.

Next morning we were visited by some hundreds of the natives; some coming in canoes, and others swimming off; so that, before ten o'clock, our decks, and all other parts of the ship, were quite full with them. My friend, who was of the number, brought me a few roots, but all the others came empty in respect to eatables. Some few had with them their arms, such as clubs and darts, which they exchanged for nails, pieces of cloth, etc. After breakfast, I sent Lieutenant Pickersgill with two armed boats to look for fresh water; for what we found the day before was by no means convenient for us to get on board. At the same time Mr Wales, accompanied by lieutenant Clerke, went to the little isle to make preparations for observing the eclipse of the sun, which was to be in the afternoon. Mr Pickersgill soon returning, informed me that he had found a stream of fresh water, pretty convenient to come at. I therefore ordered the launch to be hoisted out to complete our water, and then went to the isle to assist in the observation.

About one p.m., the eclipse came on. Clouds interposed, and we lost the first contact, but were more fortunate in the end, which was observed as follows:

By Mr Wales with Dollond's 3 1/2 foot achromatic refractor, at 3h 28' 39" 1/4 \ By Mr Clerke with Bird's 2 feet |Appa-

reflector, at 3 28 52 1/4 |rent And by me with an 18 inch reflector |time. made by Watkins, 3 28 53 1/4 / Latitude of the isle or place of observation, 20deg 17' 39" S. Longitude per distance of the sun and moon, and moon and stars, 48 sets, 164deg 41' 21" East. Ditto per watch 163 58 0

Mr Wales measured the quantity eclipsed by a Hadley's quadrant, a method never before thought of. I am of opinion it answers the purpose of a micrometer to a great degree of certainty, and is a great addition to the use of this most valuable instrument. After all was over, we returned on board, where I found Teabooma the chief, who soon after slipped out of the ship without my knowledge, and by that means lost the present I had made up for him.

In the evening I went ashore to the watering-place, which was at the head of a little creek, at a fine stream that came from the hills. It was necessary to have a small boat in the creek to convey the casks from and to the beach over which they were rolled, and then put into the launch; as only a small boat could enter the creek, and that only at high water. Excellent wood for fuel was here far more convenient than water, but this was an article we did not want. About seven o'clock this evening, died Simon Monk, our butcher, a man much esteemed in the ship; his death being occasioned by a fall down the fore-hatch-way the preceding night.

Early in the morning of the 7th, the watering-party, and a guard, under the command of an officer, were sent ashore; and soon after a party of us went to take a view of the country. As soon as we landed we made known our design to the natives, and two of them undertaking to be our guides, conducted us up the hills by a tolerably good path. In our route, we met several people, most of whom turned back with us; so that at last our train was numerous. Some we met who wanted us to return; but we paid no regard to their signs, nor did they seem uneasy when we proceeded. At length we reached the summit of one of the hills, from which we saw the sea in two places, between some advanced hills, on the opposite or S.W. side of the land. This was an useful discovery, as it enabled us to judge of the breadth of the land, which, in this part, did not exceed ten leagues.

Between those advanced hills, and the ridge we were upon, was a large valley, through which ran a serpentine river. On the banks of this were several plantations, and some villages, whose inhabitants we had met on the road, and found more on the top of the hill gazing at the ship, as might be supposed. The plain, or flat of land, which lies along the shore we were upon, appeared from the hills to great advantage; the winding streams which ran through out, the plantations, the little straggling villages, the variety in the woods, and the shoals on the coast, so variegating the scene, that the whole might afford a picture for romance. Indeed, if it were not for those fertile spots on the plains, and some few on the sides of the mountains, the whole country might be called a dreary waste. The mountains, and other high places, are, for the most part, incapable of cultivation, consisting chiefly of rocks, many of which are full of mundicks. The little soil that is upon them is scorched and burnt up with the sun; it is, nevertheless, coated with coarse grass and other plants, and here and there trees and shrubs. The country, in general, bore great resemblance to some parts of New Holland under the same parallel of latitude, several of its natural productions seeming to be the same, and the woods being without underwood, as in that country. The reefs on the coast and several other similarities, were obvious to every one who had seen both countries. We observed all the N.E. coast to be covered with shoals and breakers, extending to the northward, beyond the Isle of Balabea, till they were lost in the horizon. Having made these observations, and our guides not chusing to go farther, we descended the mountains by a road different from that by which we ascended. This brought us down through some of their plantations in the plains, which I observed were laid out with great judgment, and cultivated with much labour. Some of them were lying in fallow, some seemingly lately laid down, and others of longer date, pieces of which they were again beginning to dig up. The first thing I observed they did, was to set fire to the grass, etc. which had over-run the surface. Recruiting the land by letting it lie some years untouched, is observed by all the nations in this sea; but they seem to have no notion of manuring it, at least I have nowhere seen it done. Our excursion was finished by noon, when we returned on board to dinner; and one of our guides having left us, we brought the other with us, whose fidelity was rewarded at a small expence.

In the afternoon I made a little excursion along-shore to the westward, in company with Mr Wales. Besides making observations on such things as we met, we got the names of several places, which I then thought were islands; but upon farther enquiry, I found they were districts upon the same land. This afternoon a fish being struck by one of the natives near the watering-place, my clerk purchased it, and sent it to me after my return on board.

It was of a new species, something like a sun-fish, with a large long ugly head. Having no suspicion of its being of a poisonous nature, we ordered it to be dressed for supper; but, very luckily, the operation of drawing and describing took up so much time, that it was too late, so that only the liver and row were dressed, of which the two Mr Forsters and myself did but taste. About three o'clock in the morning, we found ourselves seized with an extraordinary weakness and numbness all over our limbs. I had almost lost the sense of feeling; nor could I distinguish between light and heavy bodies, of such as I had strength to move; a quart-pot, full of water, and a feather, being the same in my hand. We each of us took an emetic, and after that a sweat, which gave us much relief. In the morning, one of the pigs,

which had eaten the entrails, was found dead. When the natives came on board and saw the fish hanging up, they immediately gave us to understand it was not wholesome food, and expressed the utmost abhorrence of it; though no one was observed to do this when the fish was to be sold, or even after it was purchased.

On the 8th, the guard and a party of men were on shore as usual. In the afternoon, I received a message from the officer, acquainting me that Teabooma the chief was come with a present consisting of a few yams and sugar-canes. In return, I sent him, amongst other articles, a dog and a bitch, both young, but nearly full grown. The dog was red and white, but the bitch was all red, or the colour of an English fox. I mention this, because they may prove the Adam and Eve of their species in that country. When the officer returned on board in the evening, he informed me that the chief came, attended by about twenty men, so that it looked like a visit of ceremony. It was some time before he would believe the dog and bitch were intended for him; but as soon as he was convinced, he seemed lost in an excess of joy, and sent them away immediately.

Next morning early, I dispatched Lieutenant Pickersgill and Mr Gilbert with the launch and cutter to explore the coast to the west; judging this would be better effected in the boats than in the ship, as the reef would force the latter several leagues from land. After breakfast, a party of men was sent on shore, to make brooms; but myself and the two Mr Forsters were confined on board, though much better, a good sweat having had an happy effect. In the afternoon a man was seen, both ashore and alongside the ship, said to be as white as an European. From the account I had of him (for I did not see him,) his whiteness did not proceed from hereditary descent, but from chance or some disease; and such have been seen at Otaheite and the Society Isles. A fresh easterly wind, and the ship lying a mile from the shore, did not hinder those good-natured people from swimming off to us in shoals of twenty or thirty, and returning the same way.

[* Wafers met with Indians in the Isthmus of Darien of the colour of a white horse. See his 'Description of the Isthmus', page 134. See also Mr de Paw's Philosophical Enquiries concerning Americans, where several other instances of this remarkable whiteness are mentioned, and the causes of it attempted to be explained.]

On the 10th, a party was on shore as usual; and Mr Forster so well recovered as to go out botanizing.

In the evening of the 11th, the boats returned, when I was informed of the following circumstances. From an elevation which they reached the morning they set out, they had a view of the coast. Mr Gilbert was of opinion that they saw the termination of it to the west, but Mr Pickersgill thought not; though both agreed that there was no passage for the ship that way. From this place, accompanied by two of the natives, they went to Balabea, which they did not reach till after sun-set, and left again next morning before sun-rise; consequently this was a fruitless expedition, and the two following days were spent in getting up to the ship. As they went down to the isle, they saw abundance of turtle; but the violence of the wind and sea made it impossible to strike any. The cutter was near being lost, by suddenly filling with water, which obliged them to throw several things overboard, before they could free her, and stop the leak she had sprung. From a fishing canoe, which they met coming in from the reefs, they got as much fish as they could eat; and they were received by Teabi, the chief of the isle of Balabea, and the people, who came in numbers to see them, with great courtesy. In order not to be too much crowded, our people drew a line on the ground, and gave the others to understand they were not to come within it. This restriction they observed, and one of them, soon after, turned to his own advantage. For happening to have a few cocoa-nuts, which one of our people wanted to buy, and he was unwilling to part with, he walked off, and was followed by the man who wanted them. On seeing this, he sat down on the sand, made a circle round him, as he had seen our people do, and signified that the other was not to come within it; which was accordingly observed. As this story was well attested, I thought it not unworthy of a place in this journal.

Early in the morning of the 12th, I ordered the carpenter to work, to repair the cutter, and the water to be re-placed, which we had expended the three preceding days. As Tea Booma the chief had not been seen since he got the dogs, and I wanted to lay a foundation for stocking the country with hogs also, I took a young boar and a sow with me in the boat, and went up to the mangrove creek to look for my friend, in order to give them to him.

But when we arrived there, we were told that he lived at some distance, and that they would send for him. Whether they did or no I cannot say; but he not coming, I resolved to give them to the first man of note I met with. The guide we had to the hills happening to be there, I made him understand that I intended to leave the two pigs on shore, and ordered them out of the boat for that purpose. I offered them to a grave old man, thinking he was a proper person to entrust them with; but he shook his head, and he and all present, made signs to take them into the boat again. When they saw I did not comply, they seemed to consult with one another what was to be done; and then our guide told me to carry them to the Alekee (chief). Accordingly I ordered them to be taken up, and we were conducted by him to a house, wherein were seated, in a circle, eight or ten middle-aged persons. To them I and my pigs being introduced, with great courtesy they desired me to sit down; and then I began to expatiate on the merits of the two pigs, explaining to

them how many young ones the female would have at one time, and how soon these would multiply to some hundreds. My only motive was to enhance their value, that they might take the more care of them; and I had reason to think I in some measure succeeded. In the mean time, two men having left the company, soon returned with six yams, which were presented to me; and then I took my leave and went on board.

I have already observed, that here was a little village; I now found it much larger than I expected; and about it, a good deal of cultivated land, regularly laid out, planted and planting with taro or eddy root, yams, sugar-canes, and plantains. The taro plantations were prettily watered by little rills, continually supplied from the main channel at the foot of the mountains, from whence these streams were conducted in artful meanders. They have two methods of planting these roots, some are in square or oblong patches, which lie perfectly horizontal, and sink below the common level of the adjacent land, so that they can let in on them as much water as they think necessary. I have generally seen them covered two or three inches deep; but I do not know that this is always necessary. Others are planted in ridges about three or four feet broad, and two, or two and a half high. On the middle or top of the ridge, is a narrow gutter, in and along which is conveyed, as above described, a little rill that waters the roots, planted in the ridge on each side of it; and these plantations are so judiciously laid out, that the same stream waters several ridges. These ridges are sometimes the divisions to the horizontal plantations; and when this method is used, which is for the most part observed where a pathway, or something of that sort, is requisite, not an inch of ground is lost. Perhaps there may be some difference in the roots, which may make these two methods of raising them necessary. Some are better tasted than others, and they are not all of a colour; but be this as it may, they are very wholesome food, and the tops make good greens, and are eaten as such by the natives. On these plantations men, women, and children were employed.

In the afternoon I went on shore, and, on a large tree, which stood close to the shore, near the watering-place, had an inscription cut, setting forth the ship's name, date, etc. as a testimony of our being the first discoverers of this country, as I had done at all others, at which we had touched, where this ceremony was necessary. This being done, we took leave of our friends, and returned on board; when I ordered all the boats to be hoisted in, in order to be ready to put to sea in the morning.

CHAPTER IX.

A Description of the Country and its Inhabitants; their Manners, Customs, and Arts.

1774 September

I shall conclude our transactions at this place with some account of the country and its inhabitants. They are a strong, robust, active, well-made people, courteous and friendly, and not in the least addicted to pilfering, which is more than can be said of any other nation in this sea. They are nearly of the same colour as the natives of Tanna, but have better features, more agreeable countenances, and are a much stouter race; a few being seen who measured six feet four inches. I observed some who had thick lips, flat noses, and full cheeks, and, in some degree, the features and look of a negro. Two things contributed to the forming of such an idea; first, their rough mop heads, and, secondly, their besmearing their faces with black pigment. Their hair and beards are, in general, black. The former is very much frizzled, so that, at first sight, it appears like that of a negro. It is, nevertheless, very different, though both coarser and stronger than ours. Some, who wear it long, tie it up on the crown of the head; others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropped short. These rough heads, most probably, want frequent scratching; for which purpose they have a most excellent instrument. This is a kind of comb made of sticks of hard wood, from seven to nine or ten inches long, and about the thickness of knitting-needles. A number of these, seldom exceeding twenty, but generally fewer, is fastened together at one end, parallel to, and near one-tenth of an inch from each other. The other ends, which are a little pointed, will spread out or open like the sticks of a fan, by which means they can beat up the quarters of an hundred lice at a time. These combs or scratchers, for I believe they serve both purposes, they always wear in their hair, on one side their head. The people of Tanna have an instrument of this kind for the same use; but theirs is forked, I think, never exceeding three or four prongs; and sometimes only a small pointed stick. Their beards, which are of the same crisp nature as their hair, are, for the most part, worn short. Swelled and ulcerated legs and feet are common among the men; as also a swelling of the scrotum. I know not whether this is occasioned by disease, or by the mode of applying the wrapper before-mentioned, and which they use as at Tanna and Mallicollo. This is their only covering, and is made generally of the bark of a tree, but sometimes of leaves. The small pieces of cloth, paper, etc. which they got from us, were commonly applied to this use. We saw coarse garments amongst them, made of a sort of matting, but they seemed never to wear them, except when out in their canoes and unemployed. Some had a kind of concave, cylindrical, stiff black cap, which appeared to be a great ornament among them, and, we thought, was only worn by men of note or warriors. A large sheet of strong paper, when they got one from us, was generally applied to this use.

The women's dress is a short petticoat, made of the filaments of the plantain-tree, laid over a cord, to which they are fastened, and tied round the waist. The petticoat is made at least six or eight inches thick, but not one inch longer than necessary for the use designed. The outer filaments are dyed black; and, as an additional ornament, the most of them have a few pearl oyster-shells fixed on the right side. The general ornaments of both sexes are ear-rings of tortoise-shell, necklaces or amulets, made both of shells and stones, and bracelets, made of large shells, which they wear above the elbow. They have punctures, or marks on the skin, on several parts of the body; but none, I think, are black, as at the Eastern Islands. I know not if they have any other design than ornament; and the people of Tanna are marked much in the same manner.

Were I to judge of the origin of this nation, I should take them to be a race between the people of Tanna and of the Friendly Isles, or between those of Tanna and the New Zealanders, or all three; their language, in some respects, being a mixture of them all. In their disposition they are like the natives of the Friendly Isles; but in affability and honesty they excel them.

Notwithstanding their pacific inclination they must sometimes have wars, as they are well provided with offensive weapons, such as clubs, spears, darts, and slings for throwing stones. The clubs are about two feet and a half long, and variously formed; some like a scythe, others like a pick-axe; some have a head like an hawk, and others have round heads, but all are neatly made. Many of their darts and spears are no less neat, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the stones that they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They use a becket, in the same manner as at Tanna, in throwing the dart, which, I believe, is much used in striking fish, etc. In this they seem very dexterous; nor, indeed, do I know that they have any other method of catching large fish, for I neither saw hooks nor lines among them.

It is needless to mention their working-tools, as they are made of the same materials, and nearly in the same manner, as at the other islands. Their axes, indeed, are a little different; some, at least, which may be owing to fancy as much as custom.

Their houses, or at least most of them, are circular, something like a bee-hive, and full as close and warm. The entrance is by a small door, or long square hole, just big enough to admit a man bent double. The side-walls are about four feet and a half high, but the roof is lofty, and peaked to a point at the top; above which is a post, or stick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, etc. and both sides and roof are thick and close covered with thatch, made of coarse long grass. In the inside of the house are set up posts, to which cross spars are fastened, and platforms made, for the conveniency of laying any thing on. Some houses have two floors, one above the other. The floor is laid with dry grass, and here and there mats are spread, for the principal people to sleep or sit on. In most of them we found two fire-places, and commonly a fire burning; and, as there was no vent for the smoke but by the door, the whole house was both smoky and hot, insomuch that we, who were not used to such an atmosphere, could hardly endure it a moment. This may be the reason why we found these people so chilly when in the open air, and without exercise. We frequently saw them make little fires any where, and hustle round them, with no other view than to warm themselves. Smoke within doors may be a necessary evil, as it prevents the mosquitoes from coming in, which are pretty numerous here. In some respects their habitations are neat; for, besides the ornaments at top, I saw some with carved door-posts. Upon the whole, their houses are better calculated for a cold than a hot climate; and as there are no partitions in them, they can have little privacy.

They have no great variety of household utensils; the earthen jars before mentioned being the only article worth notice. Each family has at least one of them, in which they bake their roots, and perhaps their fish, etc. The fire, by which they cook their victuals, is on the outside of each house, in the open air. There are three or five pointed stones fixed in the ground, their pointed ends being about six inches above the surface. Those of three stones are only for one jar, those of five stones for two. The jars do not stand on their bottoms, but lie inclined on their sides. The use of these stones is obviously to keep the jars from resting on the fire, in order that it may burn the better.

They subsist chiefly on roots and fish, and the bark of a tree, which I am told grows also in the West Indies. This they roast, and are almost continually chewing. It has a sweetish, insipid taste, and was liked by some of our people. Water is their only liquor, at least I never saw any other made use of.

Plantains and sugar-canes are by no means in plenty. Bread-fruit is very scarce, and the cocoa-nut trees are small and but thinly planted; and neither one nor the other seems to yield much fruit.

To judge merely by the numbers of the natives we saw every day, one might think the island very populous; but I believe that, at this time, the inhabitants were collected from all parts on our account. Mr Pickersgill observed, that

down the coast, to the west, there were but few people; and we knew they came daily from the other side of the land, over the mountains, to visit us. But although the inhabitants, upon the whole, may not be numerous, the island is not thinly peopled on the sea-coast, and in the plains and valleys that are capable of cultivation. It seems to be a country unable to support many inhabitants. Nature has been less bountiful to it than to any other tropical island we know in this sea. The greatest part of its surface, or at least what we saw of it, consists of barren rocky mountains; and the grass, etc. growing on them, is useless to people who have no cattle.

The sterility of the country will apologise for the natives not contributing to the wants of the navigator. The sea may, perhaps, in some measure, compensate for the deficiency of the land; for a coast surrounded by reefs and shoals, as this is, cannot fail of being stored with fish.

I have before observed, that the country bears great resemblance to New South Wales, or New Holland, and that some of its natural productions are the same. In particular, we found here, the tree which is covered with a soft white ragged bark, easily peeled off, and is, as I have been told, the same that, in the East Indies, is used for caulking of ships. The wood is very hard, the leaves are long and narrow, of a pale dead green, and a fine aromatic; so that it may properly be said to belong to that continent. Nevertheless, here are several plants, etc. common to the eastern and northern islands, and even a species of the passionflower, which, I am told, has never before been known to grow wild any where but in America. Our botanists did not complain for want of employment at this place; every day bringing something new in botany or other branches of natural history. Land-birds, indeed, are not numerous, but several are new. One of these is a kind of crow, at least so we called it, though it is not half so big, and its feathers are tinged with blue. They also have some very beautiful turtle-doves, and other small birds, such as I never saw before.

All our endeavours to get the name of the whole island proved ineffectual. Probably it is too large for them to know by one name. Whenever we made this enquiry, they always gave us the name of some district or place, which we pointed to; and, as before observed, I got the names of several, with the name of the king or chief of each. Hence I conclude, that the country is divided into several districts, each governed by a chief; but we know nothing of the extent of his power. Balade was the name of the district we were at, and Tea Booma the chief. He lived on the other side of the ridge of hills, so that we had but little of his company, and therefore could not see much of his power. *Tea* seems a title prefixed to the names of all, or most, of their chiefs or great men. My friend honoured me by calling me *Tea* Cook.

They deposit their dead in the ground. I saw none of their burying-places, but several of the gentlemen did. In one, they were informed, lay the remains of a chief who was slain in battle; and his grave, which bore some resemblance to a large mole-hill, was decorated with spears, darts, paddles, etc. all stuck upright in the ground round about it. The canoes, which these people use, are somewhat like those of the Friendly Isles; but the most heavy clumsy vessels I ever saw. They are what I call double canoes, made out of two large trees, hollowed out, having a raised gunnel, about two inches high, and closed at each end with a kind of bulk-head of the same height; so that the whole is like a long square trough, about three feet shorter than the body of the canoe; that is, a foot and a half at each end. Two canoes, thus fitted, are secured to each other, about three feet asunder, by means of cross spars, which project about a foot over each side. Over these spars is laid a deck, or very heavy platform, made of plank, and small round spars, on which they have a fire-hearth, and generally a fire burning; and they carry a pot or jar to dress their victuals in. The space between the two canoes is laid with plank, and the rest with spars. On one side of the deck, and close to the edge, is fixed a row of knees, pretty near to each other, the use of which is to keep the masts, yards, etc. from rolling over-board. They are navigated by one or two lateen-sails, extended to a small lateen-yard, the end of which fixes in a notch or hole in the deck. The foot of the sail is extended to a small boom. The sail is composed of pieces of matting, the ropes are made of the coarse filaments of the plantain-tree, twisted into cords of the thickness of a finger; and three or four more such cords, marled together, serve them for shrouds, etc. I thought they sailed very well; but they are not at all calculated for rowing or paddling. Their method of proceeding, when they cannot sail, is by sculling, and for this purpose there are holes in the boarded deck or platform. Through these they put the sculls, which are of such a length, that, when the blade is in the water, the loom or handle is four or five feet above the deck. The man who works it stands behind, and with both his hands sculls the vessel forward. This method of proceeding is very slow; and for this reason, the canoes are but ill calculated for fishing, especially for striking of turtle, which, I think, can hardly ever be done in them. Their fishing implements, such as I have seen, are turtle-nets, made, I believe, of the filaments of the plantain-tree twisted; and small hand-nets, with very minute meshes made of fine twine and fish-gigs. Their general method of fishing, I guess, is to lie on the reefs in shoal water, and to strike the fish that may come in their way. They may, however, have other methods, which we had no opportunity to see, as no boat went out while we were here; all their time and attention being taken up with us. Their canoes are about thirty feet long, and the deck or platform about twenty-four in length, and ten in breadth. We had not, at this time, seen any timber in the country so large as that of which their canoes were made. It was observed that the holes, made in the several parts, in order to sew them together, were burnt through, but with what instrument we never learnt. Most probably it was of stone, which may be the reason why they were so fond of large spikes, seeing at once they would answer this purpose. I was convinced they were not

wholly designed for edge-tools, because every one shewed a desire for the iron belaying-pins which were fixed in the quarter-deck rail, and seemed to value them far more than a spike-nail, although it might be twice as big. These pins, which are round, perhaps have the very shape of the tool they wanted to make of the nails. I did not find that a hatchet was quite so valuable as a large spike. Small nails were of little or no value; and beads, looking-glasses, etc. they did not admire.

The women of this country, and likewise those of Tanna, are, so far as I could judge, far more chaste than those of the more eastern islands. I never heard that one of our people obtained the least favour from any one of them. I have been told that the ladies here would frequently divert themselves by going a little aside with our gentlemen, as if they meant to be kind to them, and then would run away laughing at them. Whether this was chastity or coquetry, I shall not pretend to determine; nor is it material, since the consequences were the same.

CHAPTER X.

Proceedings on the Coast of New Caledonia, with Geographical and Nautical Observations.

1774 September

Everything being in readiness to put to sea, at sun-rise, on the 13th of September, we weighed, and with a fine gale at E. by S., stood out for the same channel we came in by. At half past seven we were in the middle of it. Observatory Isle bore S. 5deg E., distant four miles, and the isle of Balabea W.N.W. As soon as we were clear of the reef, we hauled the wind to the starboard tack, with a view of plying in to the S.E.; but as Mr Gilbert was of opinion that he had seen the end, or N.W. extremity of the land, and that it would be easier to get round by the N.W., I gave over plying, and bore up along the outside of the reef, steering N.N.W., N.W., and N.W. by W., as it trended. At noon the island of Balabea bore S. by W., distant thirteen miles; and what we judged to be the west end of the great land, bore S.W. 1/2 S., and the direction of the reef was N.W. by W., latitude observed 19deg 53' 20". Longitude from Observatory Isle 14' W. We continued to steer N.W. by W. along the outside of the reef till three o'clock, at which time the isle of Balabea bore S. by E. 1/2 E. In this direction we observed a partition in the reef, which we judged to be a channel, by the strong tide which set out of it. From this place the reef inclined to the north for three or four leagues, and then to the N.W. We followed its direction, and as we advanced to N.W., raised more land, which seemed to be connected with what we had seen before; so that Mr Gilbert was mistaken, and did not see the extremity of the coast. At five o'clock this land bore W. by N. 1/2 N., distant twenty miles; but what we could see of the reef trended in the direction of N.W. by N.

Having hauled the wind to the starboard tack, and spent the night plying, on the 14th, at sun-rise, the island of Balabea bore S. 6 E., and the land seen the preceding night W., but the reef still trended N.W., along which we steered with a light breeze at E.S.E. At noon we observed in latitude 19deg 28', longitude from Observatory Isle 27' W. We had now no sight of Balabea; and the other land, that is, the N.W. part of it, bore W. by S. 1/2 S., but we were not sure if this was one continued coast, or separate islands. For though some partitions were seen, from space to space, which made it look like the latter, a multitude of shoals rendered a nearer approach to it exceedingly dangerous, if not impracticable. In the afternoon, with a fine breeze at E.S.E., we ranged the outside of these shoals, which we found to trend in the direction of N.W. by W., N.W. by N., and N.N.E. At three o'clock we passed a low sandy isle, lying on the outer edge of the reef, in latitude 19deg 25', and in the direction of N.E. from the north-westernmost land, six or seven leagues distant. So much as we could see of this space was strewn with shoals, seemingly detached from each other; and the channel leading in amongst them appeared to be on the S.E. side of the sandy isle; at least, there was a space where the sea did not break. At sun-set we could but just see the land, which bore S.W. by S., about ten leagues distant. A clear horizon produced the discovery of no land to the westward of this direction; the reef too trended away W. by N. 1/2 N., and seemed to terminate in a point which was seen from the mast-head. Thus every thing conspired to make us believe that we should soon get round these shoals; and with these flattering expectations we hauled the wind, which was at E.N.E., and spent the night making short boards.

Next morning at sun-rise, seeing neither land nor breakers, we bore away N.W. by W., and two hours after saw the reef extending N.W. farther than the eye could reach; no land was to be seen. It was therefore probable that we had passed its N.W. extremity; and, as we had seen from the hills of Balade its extent to the S.W., it was necessary to know how far it extended to the east or southeast, while it was in our power to recover the coast; for, by following the direction of the shoals, we might have been carried so far to leeward as not to be able to beat back without considerable loss of time. We were already far out of sight of land; and there was no knowing how much farther we might be carried, before we found an end to them. These considerations, together with the risk we must run in exploring a sea strewn with shoals, and where no anchorage, without them, is to be found, induced me to abandon the design of proceeding round by the N.W., and to ply up to the S.E., in which direction I knew there was a clear sea. With this view we tacked and stood to the S.E., with the wind at N.E. by E., a gentle breeze. At this time we were in the latitude of 19deg 7' S., longitude 163deg

57' E.

In standing to the S.E. we did but just weather the point of the reef we had passed the preceding evening. To make our situation the more dangerous the wind began to fail us; and at three in the afternoon it fell calm, and left us to the mercy of a great swell, setting directly on the reef, which was hardly a league from us. We sounded, but found no bottom with a line of two hundred fathoms. I ordered the pinnacle and cutter to be hoisted out to tow the ship, but they were of little use against so great a swell. We, however, found that the ship did not draw near the reef so fast as might be expected; and at seven o'clock a light air at N.N.E. kept her head to the sea, but it lasted no longer than midnight, when it was succeeded by a dead calm.

At day-break on the 16th we had no sight of the reef; and at eleven, a breeze springing up at S.S.W., we hoisted in the boats, and made sail to S.E. At noon we observed in 19deg 35' S., which was considerably more to the south than we expected, and shewed that a current or tide had been in our favour all night, and accounted for our getting so unexpectedly clear of the shoals. At two o'clock p.m. we had again a calm which lasted till nine, when it was succeeded by a light air from E.N.E. and E., with which we advanced but slowly.

On the 17th at noon, we observed in latitude 19deg 54', when the isle of Balabea bore S. 68deg W., ten and a half leagues distant. We continued to ply, with variable light winds, between N.E. and S.E., without meeting with any thing remarkable till the 20th at noon, when Cape Colnett bore N. 78deg W., distant six leagues. From this cape the land extended round by the south to E.S.E. till it was lost in the horizon, and the country appeared with many hills and vallies. Latitude observed 20deg 41', longitude made from Observatory Isle 1deg 8' E. We stood in shore with a light breeze at east till sun-set, when we were between two and three leagues off. The coast extended from S. 42deg 1/2 E. to N. 59deg W. Two small islets lay without this last direction, distant from us four or five miles; some others lay between us and the shore, and to the east, where they seemed to be connected by reefs, in which appeared some openings from space to space. The country was mountainous, and had much the same aspect as about Balade. On one of the western small isles was an elevation like a tower; and over a low neck of land within the isle were seen many other elevations, resembling the masts of a fleet of ships.

Next day at sun-rise, after having stood off all night with a light breeze at S.E., we found ourselves about six leagues from the coast; and in this situation we were kept by a calm till ten in the evening, when we got a faint land-breeze at S.W., with which we steered S.E. all night.,

On the 22d at sun-rise the land was clouded, but it was not long before the clouds went off, and we found, by our landmarks, that we had made a good advance. At ten o'clock, the land-breeze being succeeded by a sea-breeze at E. by S., this enabled us to stand in for the land, which at noon extended from N. 78deg W. to S. 31deg 1/2 E., round by the S. In this last direction the coast seemed to trend more to the south in a lofty promontory, which, on account of the day, received the name of Cape Coronation. Latitude 22deg 2', longitude 167deg 7' 1/2 E. Some breakers lay between us and the shore, and probably they were connected with those we had seen before.

During the night, we had advanced about two leagues to the S.E.; and at day-break on the 23d an elevated point appeared in sight beyond Cape Coronation, bearing S. 23deg E. It proved to be the south-east extremity of the coast, and obtained the name of Queen Charlotte's Foreland. Latitude 22deg 16' S., longitude 167deg 14' E. About noon, having got a breeze from the N.E., we stood to S.S.E., and as we drew towards Cape Coronation, saw in a valley to the south of it, a vast number of those elevated objects before-mentioned; and some low land under the foreland was wholly covered with them. We could not agree in our opinions of what they were. I supposed them to be a singular sort of trees, being too numerous to resemble any thing else; and a great deal of smoke kept rising all the day from amongst those near the cape. Our philosophers were of opinion that this was the smoke of some internal and perpetual fire. My representing to them that there was no smoke here in the morning would have been of no avail, had not this eternal fire gone out before night, and no more smoke been seen after. They were still more positive that the elevations were pillars of basaltes, like those which compose the Giant's Causeway in Ireland. At sun-set, the wind veering round to the south, we tacked and stood off, it not being safe to approach the shore in the dark. At day-break we stood in again, with a faint land-breeze between E.S.E. and S.S.E. At noon observed, in latitude 21deg 59' 30", Cape Coronation being west southerly, distant seven leagues, and the foreland S. 38deg W. As we advanced S.S.W. the coast beyond the foreland began to appear in sight; and at sun-set we discovered a low island lying S.S.E., about seven miles from the foreland. It was one of those which are generally surrounded with shoals and breakers. At the same time a round hill was seen bearing S. 24deg E, twelve leagues distant. During night, having had variable light winds, we advanced but little either way.

On the 25th, about ten o'clock a.m., having got a fair breeze at E.S.E., we stood to the S.S.W., in hopes of getting round the foreland; but, as we drew near, we perceived more low isles, beyond the one already mentioned, which at last

appeared to be connected by breakers, extending towards the foreland, and seeming to join the shore. We stood on till half past three o'clock, when we saw, from the deck, rocks, just peeping above the surface of the sea, on the shoal above-mentioned. It was now time to alter the course, as the day was too far spent to look for a passage near the shore, and we could find no bottom to anchor in during the night. We therefore stood to the south to look for a passage without the small isles. We had a fine breeze at E.S.E., but it lasted no longer than five o'clock, when it fell to a dead calm. Having sounded, a line of 170 fathoms did not reach the bottom, though we were but a little way from the shoals, which, instead of following the coast to S.W., took a S.E. direction towards the hill we had seen the preceding evening, and seemed to point out to us that it was necessary to go round that land. At this time the most advanced point on the main bore S. 68deg W., distant nine or ten leagues. About seven o'clock we got a light breeze at north, which enabled us to steer out E.S.E., and to spend the night with less anxiety. On some of the low isles were many of those elevations already mentioned. Every one was now satisfied they were trees, except our philosophers, who still maintained that they were basaltes.

About day-break on the 26th, the wind having shifted to S.S.W., we stretched to S.E. for the hill before mentioned. It belonged to an island which at noon extended from S. 16deg E. to S. 7deg W., distant six leagues. Latitude observed 22deg 16' S. In the p.m. the wind freshened, and veering to S.S.E., we stretched to the east, till two a.m., on the 27th, when we tacked and stood to S.W., with hopes of weathering the island; but we fell about two miles short of our expectations, and had to tack about a mile from the east side of the island, the extremes bearing from N.W. by N. to S.W., the hill W., and some low isles, lying off the S.E. point, S. by W. These seemed to be connected with the large island by breakers. We sounded when in stays, but had no ground with a line of eighty fathoms. The skirts of this island were covered with the elevations more than once mentioned. They had much the appearance of tall pines, which occasioned my giving that name to the island. The round hill, which is on the S.W. side, is of such a height as to be seen fourteen or sixteen leagues. The island is about a mile in circuit, and situated in latitude 22deg 38' S., longitude 167deg 40' E. Having made two attempts to weather the Isle of Pines before sun-set, with no better success, than before, this determined me to stretch off till midnight. This day at noon the thermometer was at 68deg 3/4 which is lower than it had been since the 27th of February.

Having tacked at midnight, assisted by the currents and a fresh gale at E. S.E. and S.E., next morning at day-break we found ourselves several leagues to windward of the Isle of Pines, and bore away large, round the S.E. and S. sides. The coast from the S.E., round by the S. to the W., was strewed with sand-banks, breakers, and small low isles, most of which were covered with the same lofty trees that ornamented the borders of the greater one. We continued to range the outside of these small isles and breakers, at three-fourths of a league distance, and as we passed one, raised another, so that they seemed to form a chain extending to the isles which lie off the foreland. At noon we observed, in latitude 22deg 44' 36" S. the Isle of Pines extending from N by E 1/2 E. to E. by N.; and Cape Coronation N. 32deg 30' W distant seventeen leagues. In the afternoon, with a fine gale at east, we steered N.W. by W., along the outside of the shoals, with a view of falling in with the land a little to S.W. of the foreland. At two o'clock p.m. two low islets were seen bearing W. by S., and as they were connected by breakers, which seemed to join those on our starboard, this discovery made it necessary to haul off S.W., in order to get clear of them all. At three, more breakers appeared, extending from the low isles towards the S.E. We now hauled out close to the wind, and, in an hour and a half, were almost on board the breakers, and obliged to tack. From the mast-head they were seen to extend as far as E.S.E., and the smoothness of the sea made it probable that they extended to the north of east, and that we were in a manner surrounded by them. At this time the hill on the Isle of Pines bore N. 71 1/2 E., the foreland N. 1/4 W., and the most advanced point of land on the S.W. coast bore N.W., distant fifteen or sixteen leagues. This direction of the S.W. coast, which was rather within the parallel of the N.E., assured us that this land extended no farther to the S.W. After making a short trip to N.N.E., we stood again to the south, in expectation of having a better view of the shoals before sun-set. We gained nothing by this but the prospect of a sea strewed with shoals, which we could not clear but by returning in the track by which we came. We tacked nearly in the same place where we had tacked before, and on sounding found a bottom of fine sand. But anchoring in a strong gale, with a chain of breakers to leeward, being the last resource, I rather chose to spend the night in making short boards over that space we had, in some measure, made ourselves acquainted with in the day: And thus it was spent, but under the terrible apprehension, every moment, of falling on some of the many dangers which surrounded us.

Day-light shewed that our fears were not ill-founded, and that we had been in the most imminent danger; having had breakers continually under our lee, and at a very little distance from us. We owed our safety to the interposition of Providence, a good look-out, and the very brisk manner in which the ship was managed; for, as we were standing to the north, the people on the lee-gangway and fore-castle saw breakers under the lee-bow, which we escaped by quickly tacking the ship.

I was now almost tired of a coast which I could no longer explore, but at the risk of losing the ship, and ruining the whole voyage. I was, however, determined not to leave it, till I knew what trees those were which had been the subject

of our speculation; especially as they appeared to be of a sort useful to shipping, and had not been seen any where but in the southern part of this land. With this view, after making a trip to the south, to weather the shoals under our lee, we stood to the north, in hopes of finding anchorage under some of the islets on which these trees grow. We were stopped by eight o'clock by the shoals which lie extended between the Isle of Pines and Queen Charlotte's Foreland; and found soundings off them in fifty-five, forty, and thirty-six fathoms, a fine sandy bottom. The nearer we came to these shoals, the more we saw of them, and we were not able to say if there was any passage between the two lands.

Being now but a few miles to windward of the low isles lying off the Foreland, mentioned on the 25th and 26th, I bore down to the one next to us. As we drew near it, I perceived that it was unconnected with the neighbouring shoals, and that it is probable we might get to an anchor under its lee or west side. We therefore stood on, being conducted by an officer at the mast-head; and after hauling round the point of the reef which surrounds the isle, we attempted to ply to windward, in order to get nearer the shore. Another reef to the north confined us to a narrow channel, through which ran a current against us, that rendered this attempt fruitless; so that we were obliged to anchor in thirty-nine fathoms water, the bottom fine coral sand; the isle bearing W. by N. one mile distant. As soon as this was done, we hoisted out a boat, in which I went on ashore, accompanied by the botanists. We found the tall trees to be a kind of spruce pine, very proper for spars, of which we were in want. After making this discovery, I hastened on board in order to have more time after dinner, when I landed again with two boats, accompanied by several of the officers and gentlemen, having with us the carpenter and some of his crew, to cut down such trees as were wanting. While this was doing I took the bearings of several lands round. The hill on the Isle of Pines bore S. 59 30' E; the low point of Queen Charlotte's Foreland N. 14deg 30' W.; the high land over it, seen over two low isles, N. 20deg W.; and the most advanced point of land to the west, bore west, half a point south, distant six or seven leagues. We had, from several bearings, ascertained the true direction of the coast from the foreland to this point, which I shall distinguish by the name of Prince of Wales's Foreland. It is situated in the latitude of 22deg 29' S., longitude 166deg 57' E., is of considerable height, and, when it first appears above the horizon, looks like an island. From this cape, the coast trended nearly N.W. This was rather too northerly a direction to join that part which we saw from the hills of Balade. But as it was very high land which opened off the cape in that direction, it is very probable that lower land, which we could not see, opened sooner; or else the coast more to the N.W. takes a more westerly direction, in the same manner as the N.E. coast. Be this as it may, we pretty well know the extent of the land, by having it confined within certain limits. However, I still entertained hopes of seeing more of it, but was disappointed.

The little isle upon which we landed, is a mere sandbank, not exceeding three-fourths of a mile in circuit, and on it, besides these pines, grew the Etoa-tree of Otaheite, and a variety of other trees, shrubs, and plants. These gave sufficient employment to our botanists, all the time we stayed upon it, and occasioned my calling it Botany Isle. On it were several water-snakes, some pigeons, and doves, seemingly different from any we had seen. One of the officers shot a hawk, which proved to be of the very same sort as our English fishing-hawks. Several fire-places, branches, and leaves very little decayed, remains of turtle, etc. shewed that people had lately been on the isle. The hull of a canoe, precisely of the same shape as those we had seen at Balade, lay wrecked in the sand. We were now no longer at a loss to know of what trees they make their canoes, as they can be no other than these pines. On this little isle were some which measured twenty inches diameter, and between sixty and seventy feet in length, and would have done very well for a foremast to the Resolution, had one been wanting. Since trees of this size are to be found on so small a spot, it is reasonable to expect to find some much larger on the main, and larger isles; and, if appearances did not deceive us, we can assert it.

If I except New Zealand, I, at this time, knew of no island in the South Pacific Ocean, where a ship could supply herself with a mast or yard, were she ever so much distressed for want of one. Thus far the discovery is or may be valuable. My carpenter, who was a mast-maker as well as a shipwright, two trades he learnt in Deptford-yard, was of opinion that these trees would make exceedingly good masts. The wood is white, close-grained, tough, and light. Turpentine had exuded out of most of the trees, and the sun had inspissated it into a rosin, which was found sticking to the trunks, and lying about the roots. These trees shoot out their branches like all other pines; with this difference, that the branches of these are much smaller and shorter; so that the knots become nothing when the tree is wrought for use. I took notice, that the largest of them had the smallest and shortest branches, and were crowned, as it were, at the top, by a spreading branch like a bush. This was what led some on board into the extravagant notion of their being basaltes: Indeed no one could think of finding such trees here. The seeds are produced in cones; but we could find none that had any in them, or that were in a proper state for vegetation or botanical examination. Besides these, there was another tree or shrub of the spruce-fir kind, but it was very small. We also found on the isle a sort of scurvy-grass, and a plant, called by us Lamb's Quarters, which, when boiled, eat like spinnage.

Having got ten or twelve small spars to make studding-sail booms, boat-masts, etc., and night approaching, we returned with them on board.

The purpose for which I anchored under this isle being answered, I was now to consider what was next to be done. We had from the top-mast-head taken a view of the sea around us, and observed the whole, to the west, to be strewn with small islets, sand-banks, and breakers, to the utmost extent of our horizon. They seemed indeed not to be all connected, and to be divided by winding channels. But when I considered that the extent of this S.W. coast was already pretty well determined, the great risk attending a more accurate survey, and the time it would require to accomplish it, on account of the many dangers we should have to encounter, I determined not to hazard the ship down to leeward, where we might be so hemmed in as to find it difficult to return, and by that means lose the proper season for getting to the south. I now wished to have had the little vessel set up, the frame of which we had on board. I had some thoughts of doing this, when we were last at Otaheite, but found it could not be executed, without neglecting the caulking and other necessary repairs of the ship, or staying longer there than the route I had in view would admit. It was now too late to begin setting her up, and then to use her in exploring this coast; and in our voyage to the south, she could be of no service. These reasons induced me to try to get without the shoals; that is, to the southward of them.

Next morning at day-break, we got under sail with a light breeze at E. by N. We had to make some trips to weather the shoals to leeward of Botany Isle; but when this was done the breeze began to fail; and at three p.m. it fell calm. The swell, assisted by the current, set us fast to S.W. towards the breakers, which were yet in sight in that direction. Thus we continued till ten o'clock, at which time a breeze springing up at N.N.W. we steered E.S.E.; the contrary course we had come in; not daring to steer farther south till daylight.

1774 October

At three o'clock next morning, the wind veered to S.W., blew hard, and in squalls, attended with rain, which made it necessary to proceed with our courses up and top-sails on the cap, till day-break, when the hill on the Isle of Pines bore north; and our distance from the shore in that direction was about four leagues. We had now a very strong wind at S.S.W. attended by a great sea; so that we had reason to rejoice at having got clear of the shoals before this gale overtook us. Though every thing conspired to make me think this was the westerly monsoon, it can hardly be comprehended under that name, for several reasons; first, because it was near a month too soon for these winds; secondly, because we know not if they reach this place at all; and lastly, because it is very common for westerly winds to blow within the tropics. However, I never found them to blow so hard before, or so far southerly. Be these things as they may, we had now no other choice but to stretch to S.E., which we accordingly did with our starboard tacks aboard; and at noon we were out of sight of land.

The gale continued with very little alteration till noon next day; at which time we observed in latitude 23deg 18', longitude made from the Isle of Pines 1deg 54' E. In the afternoon we had little wind from the south, and a great swell from the same direction: And many boobies, tropic, and men-of-war birds were seen. At eleven o'clock a fresh breeze sprung up at W. by S., with which we stood to the south. At this time we were in the latitude of 23deg 18', longitude 169deg 49' E., and about forty-two leagues south of the Hebrides.

At eight o'clock in the morning, on the third, the wind veered to S.W. and blew a strong gale by squalls, attended with rain. I now gave over all thought of returning to the land we had left. Indeed, when I considered the vast ocean we had to explore to the south; the state and condition of the ship, already in want of some necessary stores; that summer was approaching fast, and that any considerable accident might detain us in this sea another year; I did not think it advisable to attempt to regain the land.

Thus I was obliged, as it were by necessity, for the first time, to leave a coast I had discovered, before it was fully explored.--I called it New Caledonia; and, if we except New Zealand, it is perhaps the largest island in the South Pacific Ocean. For it extends from the latitude of 19deg 37', to 22deg 30', S., and from the longitude of 163deg 37' to 167deg 14' E. It lies nearly N.W. 1/2 W., and S.E. 1 E., and is about eighty-seven leagues long in that direction; but its breadth is not considerable, not any where exceeding ten leagues. It is a country full of hills and valleys; of various extent both for height and depth. To judge of the whole by the parts we were on, from these hills spring vast numbers of little rivulets, which greatly contribute to fertilize the plains, and to supply all the wants of the inhabitants. The summits of most of the hills seem to be barren; though some few are clothed with wood; as are all the plains and valleys. By reason of these hills, many parts of the coast, when at a distance from it, appeared indented, or to have great inlets between the hills; but, when we came near the shore, we always found such places shut up with low land, and also observed low land to lie along the coast between the seashore and the foot of the hills. As this was the case in all such parts as we came near enough to see, it is reasonable to suppose that the whole coast is so. I am likewise of opinion, that the whole, or greatest part, is surrounded by reefs or shoals, which render the access to it very dangerous, but at the same time guard the coast from the violence of the wind and sea; make it abound with fish, secure an easy and safe navigation along it, for canoes, etc.; and, most likely, form some good harbours for shipping. Most, if not every part of the coast, is inhabited, the Isle of Pines not excepted; for we saw either smoke by day, or fires by night, wherever we

came. In the extent which I have given to this island, is included the broken or unconnected lands to the N.W. That they may be connected; I shall not pretend to deny; we were, however, of opinion that they were isles, and that New Caledonia terminated more to S.E.; though this at most is but a well-founded conjecture.

But whether these lands be separate isles, or connected with New Caledonia, it is by no means certain that we saw their termination to the west. I think we did not; as the shoals did not end with the land we saw, but kept their N.W. direction farther than Bougainville's track in the latitude of 15deg or 15deg 1/2. Nay, it seems not improbable, that a chain of isles, sand-banks, and reefs, may extend to the west, as far as the coast of New South Wales. The eastern extent of the isles and shoals off that coast, between the latitude of 15deg and 23', were not known. The resemblance of the two countries; *Bougainville's meeting with the shoal of Diana above sixty leagues from the coast; and the signs he had of land to the S.E.; all tend to increase the probability. I must confess that it is carrying probability and conjecture a little too far, to say what may lie in a space of two hundred leagues; but it is in some measure necessary, were it only to put some future navigator on his guard.

[See his Voyage, English translation p.303.]

Mr Wales determined the longitude of that part of New Caledonia we explored, by ninety-six sets of observations, which were reduced to one another by our trusty guide the watch. I found the variation of the compass to be 10deg 24' E. This is the mean variation given by the three azimuth compasses we had on board, which would differ from each other a degree and a half, and sometimes more. I did not observe any difference in the variation between the N.W. and S.E. parts of this land, except when we were at anchor before Balade, where it was less than 10deg; but this I did not regard, as I found such a uniformity out at sea; and it is there where navigators want to know the variation. While we were on the N.E. coast, I thought the currents set to S.E. and W. or N.W. on the other side; but they are by no means considerable, and may, as probably, be channels of tides, as regular currents. In the narrow channels which divide the shoals, and those which communicate with the sea, the tides run strong; but their rise and fall are inconsiderable, not exceeding three feet and a half. The time of high-water, at the full and change, at Balade, is about six o'clock; but at Botany Isle we judged it would happen about ten or eleven o'clock.

CHAPTER XI.

Sequel of the Passage from New Caledonia to New Zealand, with an Account of the Discovery of Norfolk Island; and the Incidents that happened while the Ship lay in Queen Charlotte's Sound.

1774 October

The wind continuing at S.W., W.S.W., and W., blowing a fresh gale, and now and then squalls, with showers of rain, we steered to S.S.E, without meeting with any remarkable occurrence till near noon on the 6th, when it fell calm. At this time we were in the latitude of 27deg 50' S., longitude 171deg 43' E. The calm continued till noon the next day, during which time we observed the variation to be 10deg 33' E. I now ordered the carpenters to work to caulk the decks. As we had neither pitch, tar, nor rosin, left to pay the seams, this was done with varnish of pine, and afterwards covered with coral sand, which made a cement far exceeding my expectation. In the afternoon, we had a boat in the water, and shot two albatrosses, which were geese to us. We had seen one of this kind of birds the day before, which was the first we observed since we had been within the tropic. On the 7th, at one p.m. a breeze sprung up at south; soon after it veered to, and fixed at S.E. by S., and blew a gentle gale, attended with pleasant weather.

We stretched to W.S.W., and next day at noon were in the latitude of 28deg 25', longitude 170deg 26' E. In the evening, Mr Cooper having struck a porpoise with a harpoon, it was necessary to bring-to, and have two boats out, before we could kill it, and get it on board. It was six feet long; a female of that kind, which naturalists call dolphin of the ancients, and which differs from the other kind of porpoise in the head and jaw, having them long and pointed. This had eighty-eight teeth in each jaw. The haslet and lean flesh were to us a feast. The latter was a little liverish, but had not the least fishy taste. It was eaten roasted, broiled, and fried, first soaking it in warm water. Indeed, little art was wanting to make any thing fresh, palatable to those who had been living so long on salt meat.

We continued to stretch to W.S.W. till the 10th, when at day-break we discovered land, bearing S.W., which on a nearer approach we found to be an island of good height, and five leagues in circuit. I named it Norfolk Isle, in honour of the noble family of Howard. It is situated in the latitude of 29deg 2' 30" S. and longitude 168deg 16' E. The latter was determined by lunar observations made on this, the preceding, and following days; and the former by a good observation at noon, when we were about three miles from the isle. Soon after we discovered the isle, we sounded in twenty-two fathoms on a bank of coral sand; after this we continued to sound, and found not less than twenty-two; or more than twenty-four fathoms (except near the shore), and the same bottom mixed with broken shells. After dinner a

party of us embarked in two boats, and landed on the island, without any difficulty, behind some large rocks, which lined part of the coast on the N.E. side.

We found it uninhabited, and were undoubtedly the first that ever set foot on it. We observed many trees and plants common at New Zealand; and, in particular, the flax-plant, which is rather more luxuriant here than in any part of that country; but the chief produce is a sort of spruce-pine, which grows in great abundance, and to a large size, many of the trees being as thick, breast high, as two men could fathom, and exceedingly straight and tall. This pine is a sort between that which grows in New Zealand, and that in New Caledonia; the foliage differing something from both, and the wood not so heavy as the former, nor so light and close-grained as the latter. It is a good deal like the Quebec pine. For about two hundred yards from the shore, the ground is covered so thick with shrubs and plants, as hardly to be penetrated farther inland. The woods were perfectly clear and free from underwood, and the soil seemed rich and deep.

We found the same kind of pigeons, parrots, and parroquets as in New Zealand, rails, and some small birds. The sea-fowl are, white boobies, gulls, tern, etc. which breed undisturbed on the shores, and in the cliffs of the rocks.

On the isle is fresh water; and cabbage-palm, wood-sorrel, sow-thistle, and samphire, abounding in some places on the shore, we brought on board as much of each sort as the time we had to gather them would admit. These cabbage-trees or palms were not thicker than a man's leg, and from ten to twenty feet high. They are of the same genus with the cocoa-nut tree; like it they have large pinnated leaves, and are the same as the second sort found in the northern parts of New South Wales*. The cabbage is, properly speaking, the bud of the tree; each tree producing but one cabbage, which is at the crown, where the leaves spring out, and is inclosed in the stem. The cutting off the cabbage effectually destroys the tree; so that no more than one can be had from the same stem. The cocoa-nut tree, and some others of the palm kind, produce cabbage as well as these. This vegetable is not only wholesome, but exceedingly palatable, and proved the most agreeable repast we had for some time.

[Vide Hawkesworth's Voyages, Vol III, Page 624.]

The coast does not want fish. While we were on shore, the people in the boats caught some which were excellent. I judged that it was high water at the full and change, about one o'clock; and that the tide rises and falls upon a perpendicular about four or five feet.

The approach of night brought us all on board, when we hoisted in the boats, and stretched to E.N.E. (with the wind at S.E.) till midnight, when we tacked, and spent the remainder of the night making short boards.

Next morning at sun-rise, we made sail, stretching to S.S.W., and weathered the island; on the south side of which lie two isles, that serve as roosting and breeding-places for birds. On this, as also on the S.E. side, is a sandy beach; whereas most of the other shores are bounded by rocky cliffs, which have twenty and eighteen fathoms water close to them: At least so we found it on the N.E. side, and with good anchorage. A bank of coral sand, mixed with shells, on which we found from nineteen to thirty-five or forty fathoms water, surrounds the isle, and extends, especially to the south, seven leagues off. The morning we discovered the island, the variation was found to be 13deg 9' E.; but I think this observation gave too much, as others which we had, both before and after, gave 2deg less.

After leaving Norfolk Isle, I steered for New Zealand, my intention being to touch at Queen Charlotte's Sound, to refresh my crew, and put the ship in a condition to encounter the southern latitudes.

On the 17th, at day-break, we saw Mount Egmont, which was covered with everlasting snow, bearing S.E. 1/2 E. Our distance from the shore was about eight leagues, and, on sounding, we found seventy fathoms water, a muddy bottom. The wind soon fixed in the western board, and blew a fresh gale, with which we steered S.S.E. for Queen Charlotte's Sound, with a view of falling in with Cape Stephens. At noon Cape Egmont bore E.N.E. distant three or four leagues; and though the mount was hid in the clouds, we judged it to be in the same direction as the Cape; latitude observed 39deg 24'. The wind increased in such a manner as to oblige us to close-reef our top-sails, and strike top-gallant yards. At last we could bear no more sail than the two courses, and two close-reefed top-sails; and under them we stretched for Cape Stephens, which we made at eleven o'clock at night.

At midnight we tacked and made a trip to the north till three o'clock next morning, when we bore away for the sound. At nine we hauled round Point Jackson through a sea which looked terrible, occasioned by a rapid tide, and a high wind; but as we knew the coast, it did not alarm us. At eleven o'clock we anchored before Ship Cove; the strong flurries from off the land not permitting us to get in.

In the afternoon, as we could not move the ship, I went into the Cove, with the seine, to try to catch some fish. The first thing I did after landing, was to look for the bottle I left hid when last there, in which was the memorandum. It was taken

away, but by whom it did not appear. Two hauls with the seine producing only four small fish, we, in some measure, made up for this deficiency, by shooting several birds, which the flowers in the garden had drawn thither, as also some old shags, and by robbing the nests of some young ones.

Being little wind next morning, we weighed and warped the ship into the Cove, and there moored with the two bowers. We unbent the sails to repair them; several having been split, and otherwise damaged in the late gale. The main and fore courses, already worn to the very utmost, were condemned as useless. I ordered the top-masts to be struck and unrigged, in order to fix to them moveable chocks or knees, for want of which the trestle-trees were continually breaking; the forge to be set up, to make bolts and repair our iron-work; and tents to be erected on shore for the reception of a guard, coopers, sail-makers, etc. I likewise gave orders that vegetables (of which there were plenty) should be boiled every morning with oatmeal and portable broth for breakfast, and with pease and broth every day for dinner for the whole crew, over and above their usual allowance of salt meat.

In the afternoon, as Mr Wales was setting up his observatory, he discovered that several trees, which were standing when we last sailed from this place, had been cut down with saws and axes; and a few days after, the place where an observatory, clock, etc. had been set up, was also found, in a spot different from that where Mr Wales had placed his. It was, therefore, now no longer to be doubted, that the Adventure had been in this cove after we had left it.

Next day, wind southerly; hazy clouded weather. Every body went to work at their respective employments, one of which was to caulk the ship's sides, a thing much wanted. The seams were paid with putty, made with cook's fat and chalk; the gunner happening to have a quantity of the latter on board.

The 21st, wind southerly, with continual rains.

The weather being fair in the afternoon of the 22d, accompanied by the botanists, I visited our gardens on Motuara, which we found almost in a state of nature, having been wholly neglected by the inhabitants. Nevertheless, many articles were in a flourishing condition, and shewed how well they liked the soil in which they were planted. None of the natives having yet made their appearance, we made a fire on the point of the island, in hopes, if they saw the smoke, they might be induced to come to us.

Nothing remarkable happened till the 24th, when, in the morning, two canoes were seen coming down the sound; but as soon as they perceived the ship, they retired behind a point on the west side. After breakfast I went in a boat to look for them; and as we proceeded along the shore, we shot several birds. The report of the muskets gave notice of our approach, and the natives discovered themselves in Shag Cove by hallooing to us; but as we drew near to their habitations, they all fled to the woods, except two or three men, who stood on a rising ground near the shore, with their arms in their hands. The moment we landed, they knew us. Joy then took place of fear; and the rest of the natives hurried out of the woods, and embraced us over and over again; leaping and skipping about like madmen, but I observed that they would not suffer some women, whom we saw at a distance, to come near us. After we had made them presents of hatchets, knives, and what else we had with us, they gave us in return a large quantity of fish, which they had just caught. There were only a few amongst them whose faces we could recognise, and on our asking why they were afraid of us, and enquiring for some of our old acquaintances by name, they talked much about killing, which was so variously understood by us, that we could gather nothing from it, so that, after a short stay, we took leave, and went on board.

Next morning early, our friends, according to a promise they had made us the preceding evening, paying us a visit, brought with them a quantity of fine fish, which they exchanged for Otaheitean cloth, etc. and then returned to their habitations.

On the 26th, we got into the after-hold four boat-load of shingle ballast, and struck down six guns, keeping only six on deck. Our good friends the natives, having brought us a plentiful supply of fish, afterwards went on shore to the tents, and informed our people there, that a ship like ours had been lately lost in the strait; that some of the people got on shore; and that the natives stole their clothes, etc. for which several were shot; and afterwards, when they could fire no longer, the natives having got the better, killed them with their patapatoos, and eat them, but that they themselves had no hand in the affair, which, they said, happened at Vanna Aroa, near Terrawhitte, on the other side of the strait. One man said it was two moons ago: But another contradicted him, and counted on his fingers about twenty or thirty days. They described by actions how the ship was beat to pieces by going up and down against the rocks, till at last it was all scattered abroad.

The next day some others told the same story, or nearly to the same purport, and pointed over the east bay, which is on the east side of the sound, as to the place where it happened. These stories making me very uneasy about the

Adventure, I desired Mr Wales, and those on shore, to let me know if any of the natives should mention it again, or to send them to me; for I had not heard any thing from them myself. When Mr Wales came on board to dinner he found the very people who had told him the story on shore, and pointed them out to me. I enquired about the affair, and endeavoured to come at the truth by every method I could think of. All I could get from them was, "Caurey," (no); and they not only denied every syllable of what they had said on shore, but seemed wholly ignorant of the matter; so that I began to think our people had misunderstood them, and that the story referred to some of their own people and boats.

On the 28th, fresh gales westerly, and fair weather. We rigged and fitted the top-masts. Having gone on a shooting-party to West Bay, we went to the place where I left the hogs and fowls; but saw no vestiges of them, nor of any body having been there since. In our return, having visited the natives, we got some fish in exchange for trifles which we gave them. As we were coming away, Mr Forster thought he heard the squeaking of a pig in the woods, close by their habitations; probably they may have those I left with them when last here. In the evening we got on board, with about a dozen and a half of wild fowl, shags, and sea-pies. The sportsmen who had been out in the woods near the ship were more successful among the small birds.

On the 29th and 30th nothing remarkable happened, except that in the evening of the latter all the natives left us.

The 31st being a fine pleasant day, our botanists went over to Long Island, where one of the party saw a large black boar. As it was described to me, I thought it might be one of those which Captain Furneaux left behind, and had been brought over to this isle by those who had it in keeping. Since they did not destroy those hogs when first in their possession, we cannot suppose they will do it now; so that there is little fear but that this country will in time be stocked with these animals, both in a wild and domestic state.

1774 November

Next day we were visited by a number of strangers who came up from the sound, and brought with them but little fish. Their chief commodity was green stone or talc, an article which never came to a bad market; and some of the largest pieces of it I had ever seen were got this day.

On the 2d I went over to the east side of the sound, and, without meeting any thing remarkable, returned on board in the evening, when I learnt that the same people who visited us the preceding day, had been on board most of this, with their usual article of trade.

On the 3d, Mr Pickersgill met with some of the natives, who related to him the story of a ship being lost, and the people being killed; but added, with great earnestness, it was not done by them.

On the 4th, fine pleasant weather. Most of the natives now retired up the sound. Indeed, I had taken every gentle method, to oblige them to be gone, for since these newcomers had been with us, our old friends had disappeared, and we had been without fish. Having gone over to Long Island, to look for the hog which had been seen there, I found it to be one of the sows left by Captain Furneaux; the same that was in the possession of the natives when we were last here. From the supposition of its being a boar, I had carried over a sow to leave with him; but on seeing my mistake, brought her back, as the leaving her there would answer no end.

Early in the morning of the 5th, our old friends made us a visit, and brought a seasonable supply of fish. At the same time I embarked in the pinnace, with Messrs Forsters and Sparman, in order to proceed up the sound. I was desirous of finding the termination of it; or rather of seeing if I could find any passage out to sea by the S.E., as I suspected from some discoveries I had made when first here. In our way up, we met with some fishers, of whom we made the necessary enquiry; and they all agreed that there was no passage to the sea by the head of the sound. As we proceeded, we, some time after, met a canoe conducted by four men coming down the sound. These confirmed what the others had said, in regard to there being no passage to the sea the way we were going; but gave us to understand that there was one to the east, in the very place where I expected to find it. I now laid aside the scheme of going to the head of the sound, and proceeded to this arm, which is on the S.E. side, about four or five leagues above the isle of Motuara.

A little within the entrance on the S.E. side, at a place called Kotieghenoee, we found a large settlement of the natives. The chief, whose name was Tringo-boohee, and his people, whom we found to be some of those who had lately been on board the ship, received us with great courtesy. They seemed to be pretty numerous both here and in the neighbourhood. Our stay with them was short, as the information they gave us encouraged us to pursue the object we had in view. Accordingly, we proceeded down the arm E.N.E. and E. by N., leaving several fine coves on both sides, and at last found it to open into the strait by a channel about a mile wide, in which ran out a strong tide; having also observed one setting down the arm, all the time we had been in it. It was now about four o'clock in the afternoon, and in less than an hour after, this tide ceased, and was succeeded by the flood, which came in with equal strength.

The outlet lies S.E. by E. and N.W. by W. and nearly in the direction of E.S.E. and W.N.W. from Cape Terrawhitte. We found thirteen fathoms water a little within the entrance, clear ground. It seemed to me that a leading wind was necessary to go in and out of this passage, on account of the rapidity of the tides. I, however, had but little time to make observations of this nature, as night was at hand, and I had resolved to return on board. On that account I omitted visiting a large *hippa*, or strong-hold, built on an elevation on the north side, and about a mile or two within the entrance. The inhabitants of it, by signs, invited us to go to them; but, without paying any regard to them, we proceeded directly for the ship, which we reached by ten o'clock, bringing with us some fish we had got from the natives, and a few birds we had shot. Amongst the latter were some of the same kinds of ducks we found in Dusky Bay, and we have reason to believe that they are all to be met with here. For the natives knew them all by the drawings, and had a particular name for each.

On the 6th, wind at N.E., gloomy weather with rain. Our old friends having taken up their abode near us, one of them, whose name was Pederro, (a man of some note,) made me a present of a staff of honour, such as the chiefs generally carry. In return, I dressed him in a suit of old clothes, of which he was not a little proud. He had a fine person, and a good presence, and nothing but his colour distinguished him from an European. Having got him, and another, into a communicative mood, we began to enquire of them if the Adventure had been there during my absence; and they gave us to understand, in a manner which admitted of no doubt, that, soon after we were gone, she arrived; that she staid between ten and twenty days, and had been gone ten months. They likewise asserted that neither she, nor any other ship, had been stranded on the coast, as had been reported. This assertion, and the manner in which they related the coming and going of the Adventure, made me easy about her; but did not wholly set aside our suspicions of a disaster having happened to some other strangers. Besides what has been already related, we had been told that a ship had lately been here, and was gone to a place called Terato, which is on the north side of the strait. Whether this story related to the former or no, I cannot say. Whenever I questioned the natives about it, they always denied all knowledge of it, and for some time past, had avoided mentioning it. It was but a few days before, that one man received a box on the ear for naming it to some of our people.

After breakfast I took a number of hands over to Long Island, in order to catch the sow, to put her to the boar and remove her to some other place; but we returned without seeing her. Some of the natives had been there not long before us, as their fires were yet burning; and they had undoubtedly taken her away. Pederro dined with us, eat of every thing at table, and drank more wine than any one of us, without being in the least affected by it.

The 7th, fresh gales at N.E. with continual rain.

The 8th, fore-part rain, remainder fair weather. We put two pigs, a boar, and a sow, on shore, in the cove next without Cannibal Cove; so that it is hardly possible all the methods I have taken to stock this country with these animals should fail. We had also reason to believe that some of the cocks and hens which I left here still existed, although we had not seen any of them; for an hen's egg was, some days before, found in the woods almost new laid.

On the 9th, wind westerly or N.W., squally with rain. In the morning we unmoored, and shifted our birth farther out of the cove, for the more ready getting to sea the next morning; for at present the caulkers had not finished the sides, and till this work was done we could not sail. Our friends having brought us a very large and seasonable supply of fish, I bestowed on Pederro a present of an empty oil-jar, which made him as happy as a prince. Soon after, he and his party left the cove, and retired to their proper place of abode, with all the treasure they had received from us. I believe that they gave away many of the things they, at different times, got from us, to their friends and neighbours, or else parted with them to purchase peace of their more powerful enemies; for we never saw any of our presents after they were once in their possession: And every time we visited them they were as much in want of hatchets, nails, etc. to all appearance, as if they never had had any among them.

I am satisfied that the people in this sound, who are, upon the whole, pretty numerous, are under no regular form of government, or so united as to form one body politic. The head of each tribe, or family, seems to be respected; and that respect may, on some occasions, command obedience; but I doubt if any amongst them have either a right or power to enforce it. The day we were with Tringo-boohee, the people came from all parts to see us, which he endeavoured to prevent. But though he went so far as to throw stones at some, I observed that very few paid any regard either to his words or actions; and yet this man was spoken of as a chief of some note. I have, before, made some remarks on the evils attending these people for want of union among themselves; and the more I was acquainted with them, the more I found it to be so. Notwithstanding they are cannibals, they are naturally of a good disposition, and have not a little humanity.

In the afternoon a party of us went ashore into one of the coves, where were two families of the natives variously employed; some sleeping, some making mats, others roasting fish and fir roots, and one girl, I observed, was heating of

stones. Curious to know what they were for, I remained near her. As soon as the stones were made hot, she took them out of the fire, and gave them to an old woman, who was sitting in the hut. She placed them in a heap, laid over them a handful of green celery, and over that a coarse mat, and then squatted herself down, on her heels, on the top of all; thus making a kind of Dutch warming-pan, on which she sat as close as a hare on her seat. I should hardly have mentioned this operation, if I had thought it had no other view than to warm the old woman's backside. I rather suppose it was intended to cure some disorder she might have on her, which the steams arising from the green celery might be a specific for. I was led to think so by there being hardly any celery in the place, we having gathered it long before; and grass, of which there was great plenty, would have kept the stones from burning the mat full as well, if that had been all that was meant. Besides, the woman looked to me sickly, and not in a good state of health.

Mr Wales, from time to time, communicated to me the observations he had made in this Sound for determining the longitude, the mean results of which give 174deg 25' 7" 1/2 east, for the bottom of Ship Cove, where the observations were made; and the latitude of it is 41deg 5' 50" 1/2 south. In my chart, constituted in my former voyage, this place is laid down in 184deg 54' 30" west, equal to 175deg 5' 30" east. The error of the chart is therefore 0deg 40' 0", and nearly equal to what was found at Dusky Bay; by which it appears that the whole of Tavai-poenamoo is laid down 40' too far east in the said chart, as well as in the journal of the voyage. But the error in Eaheino-mauwe, is not more than half a degree, or thirty minutes; because the distance between Queen Charlotte's Sound and Cape Palliser has been found to be greater by 10' of longitude than it is laid down in the chart. I mention these errors, not from a fear that they will affect either navigation or geography, but because I have no doubt of their existence; for, from the multitude of observations which Mr Wales took, the situation of few parts of the world is better ascertained than Queen Charlotte's Sound. Indeed, I might, with equal truth, say the same of all the other places where we made any stay; for Mr Wales, whose abilities are equal to his assiduity, lost no one observation that could possibly be obtained. Even the situation of those islands, which we passed without touching at them, is, by means of Kendal's watch, determined with almost equal accuracy. The error of the watch from Otaheite to this place was only 43' 39" 1/2 in longitude, reckoning at the rate it was found to go at, at that island and at Tanna; but by reckoning at the rate it was going when last at Queen Charlotte's Sound, and from the time of our leaving it, to our return to it again, which was near a year, the error was 19' 31", 25 in time, or 4deg 52' 48" 1/4 in longitude. This error cannot be thought great, if we consider the length of time, and that we had gone over a space equal to upwards of three-fourths of the equatorial circumference of the earth, and through all the climates and latitudes from 9deg to 71deg. Mr Wales found its rate of going here to be that of gaining 12", 576, on mean time, per day.

The mean result of all the observations he made for ascertaining the variation of the compass and the dip of the south end of the needle, the three several times we had been here, gave 14deg 9' 1/5 east for the former; and 64deg 36" 2/3 for the latter. He also found, from very accurate observations, that the time of high-water preceded the moon's southing, on the full and change days, by three hours; and that the greatest rise and fall of the water was five feet ten inches, and a half; but there were evident tokens on the beach, of its having risen two feet higher than ever it did in the course of his experiments.

A VOYAGE TOWARDS THE SOUTH POLE, AND ROUND THE WORLD.

BOOK IV.

FROM LEAVING NEW ZEALAND TO OUR RETURN TO ENGLAND.

CHAPTER I.

The Run from New Zealand to Terra del Fuego, with the Range from Cape Deseada to Christmas Sound, and Description of that Part of the Coast.

1774 November

At day-break on the 10th, with a fine breeze at W.N.W., we weighed and stood out of the Sound; and, after getting round the Two Brothers, steered for Cape Campbell, which is at the S.W. entrance of the Strait, all sails set, with a fine breeze at north. At four in the afternoon, we passed the Cape, at the distance of four or five leagues, and then steered S.S.E. 1/2 E. with the wind at N.W., a gentle gale, and cloudy weather.

Next morning the wind veered round by the west to south, and forced us more to the east than I intended. At seven o'clock in the evening, the snowy mountains bore W. by S., and Cape Palliser N. 1/2 W., distant sixteen or seventeen leagues; from which cape I, for the third time, took my departure. After a few hours calm, a breeze springing up at north, we steered S. by E. all sails set, with a view of getting into the latitude of 54deg or 55deg; my intention being to cross this vast ocean nearly in these parallels, and so as to pass over those parts which were left unexplored the preceding

summer.

In the morning of the 12th, the wind increased to a fine gale: At noon we observed in latitude 43deg 13' 30" S., longitude 176deg 41' E.; an extraordinary fish of the whale kind was seen, which some called a sea monster. I did not see it myself. In the afternoon, our old companions the pintado peterels began to appear.

On the 13th, in the morning, the wind veered to W.S.W. At seven, seeing the appearance of land to S.W., we hauled up towards it, and soon found it to be a fog-bank. Afterwards we steered S.E. by S., and soon after saw a seal. At noon, latitude, by account, 44deg 25', longitude 177deg 31' E. Foggy weather, which continued all the afternoon. At six in the evening, the wind veered to N.E. by N., and increased to a fresh gale, attended with thick hazy weather; course steered S.E. 1/4 S.

On the 14th, a.m. saw another seal. At noon, latitude 45deg 54', longitude 179deg 29' E.

On the 15th, a.m. the wind veered to the westward; the fog cleared away, but the weather continued cloudy. At noon, latitude 47deg 30', longitude 178deg 19' W.; for, having passed the meridian of 180deg E., I now reckon my longitude west of the first meridian, viz. Greenwich. In the evening heard penguins, and the next morning saw some sea or rock weed. At noon a fresh gale from the west and fine weather. Latitude observed 49deg 33', longitude 175deg 31' W.

Next morning fresh gales and hazy weather; saw a seal and several pieces of weed. At noon, latitude 51deg 12', longitude 173deg 17' W. The wind veered to the N. and N.E. by N., blew a strong gale by squalls, which split an old topgallant sail, and obliged us to double-reef the top-sails; but in the evening the wind moderated, and veered to W.N.W., when we loosed a reef out of each top-sail; and found the variation of the compass to be 9deg 52' E., being then in the latitude 51deg 47', longitude 172deg 21' W., and the next morning, the 18th, in the latitude of 52deg 25', longitude 170deg 45' W., it was 10deg 26' E. Towards noon, had moderate but cloudy weather, and a great swell from the west: Some penguins and pieces of sea-weed seen.

On the 19th, steered E.S.E, with a very fresh gale at north, hazy dirty weather. At noon, latitude 53deg 43', longitude 166deg 15' W.

On the 20th, steered E. by S., with a moderate breeze at north, attended with thick hazy weather. At noon, latitude 54deg 8', longitude 162deg 18' W.

On the 21st, winds mostly from the N.E., a fresh gale attended with thick, hazy, dirty weather. Course S.E. by S.; latitude, at noon, 55deg 31', longitude 160deg 29'; abundance of blue peterels and some penguins seen.

Fresh gales at N.W. by N. and N. by W., and hazy till towards noon of the 22d, when the weather cleared up, and we observed in latitude 55deg 48' S., longitude 156deg 56' W. In the afternoon had a few hours calm; after that, the wind came at S.S.E. and S.E. by S. a light breeze, with which we steered east northerly. In the night the aurora australis was visible, but very faint, and no ways remarkable.

On the 23d, in the latitude of 55deg 46' S., longitude 156deg 13' W., the variation was 9deg 42' E. We had a calm from ten in the morning till six in the evening, when a breeze sprung up at west; at first it blew a gentle gale, but afterwards freshened. Our course was now E. 1/2 N.

On the 24th, a fresh breeze at N.W. by W. and N. by W. At noon, in latitude 55deg 38' S., longitude 153deg 37' W., foggy in the night, but next day had a fine gale at N.W., attended with clear pleasant weather; course steered E. by N. In the evening, being in the latitude of 55deg 8' S., longitude 148deg 10' W., the variation, by the mean of two compasses, was 6deg 35' E.

Having a steady fresh gale at N.N.W. on the 26th and 27th, we steered east; and at noon on the latter were in latitude 55deg 6' S., longitude 138deg 56' W.

I now gave up all hopes of finding any more land in this ocean, and came to a resolution to steer directly for the west entrance of the Straits of Magalhaeus, with a view of coasting the out, or south side of Terra del Fuego round Cape Horn to the strait Le Maire. As the world has but a very imperfect knowledge of this shore, I thought the coasting of it would be of more advantage, both to navigation and to geography, than any thing I could expect to find in a higher latitude. In the afternoon of this day, the wind blew in squalls, and carried away the main top-gallant mast.

A very strong gale northerly, with hazy rainy weather, on the 28th, obliged us to double-reef the fore and main top-sail to hand the mizen top-sail, and get down the fore top-gallant yard. In the morning, the bolt rope of the main top-sail

broke, and occasioned the sail to be split. I have observed that the ropes to all our sails, the square sails especially, are not of a size and strength sufficient to wear out the canvass. At noon, latitude 55deg 20' S., longitude 134deg 16' W., a great swell from N.W.: Albatrosses and blue peterels seen.

Next day towards noon, the wind abating, we loosed all the reefs out of the top-sails, rigged another top-gallant mast, and got the yards across. P.M. little wind, and hazy weather; at midnight calm, that continued till noon the next day, when a breeze sprung up at east, with which we stretched to the northward. At this time we were in the latitude 55deg 32' S., longitude 128deg 45' W.; some albatrosses and peterels seen. At eight, p.m., the wind veering to N.E., we tacked and stood to E.S.E.

1774 December

On the 1st of December, thick hazy weather, with drizzling rain, and a moderate breeze of wind, which, at three o'clock p.m. fell to a calm; at this time in latitude 55deg 41' S., longitude 127deg 5' W. After four hours calm, the fog cleared away, and we got a wind at S.E. with which we stood N.E.

Next day, a fresh breeze at S.E. and hazy foggy weather, except a few hours in the morning, when we found the variation to be 1deg 28' E. Latitude 55deg 17', longitude 125deg 41' W. The variation after this was supposed to increase; for on the 4th, in the morning, being in latitude 53deg 31', longitude 121deg 31' W., it was 3deg 16' E.; in the evening, in latitude 53deg 13', longitude 119deg 46' W., it was 3deg 28' E.; and on the 5th, at six o'clock in the evening, in latitude 53deg 8', longitude 115deg 58' W., it was 4deg 1' E.

For more than twenty-four hours, having had a fine gale at south, this enabled us to steer east, with very little deviation to the north; and the wind now altering to S.W. and blowing a steady fresh breeze, we continued to steer east, inclining a little to south.

On the 6th, had some snow-showers. In the evening, being in latitude 53deg 13', longitude 111deg 12', the variation was 4deg 58' E.; and the next morning, being in latitude 58deg 16', longitude 109deg 33', it was 5deg 1' E.

The wind was now at west, a fine pleasant gale, sometimes with showers of rain. Nothing remarkable happened, till the 9th, at noon, when being in the latitude of 53deg 37', longitude 103deg 44' W., the wind veered to N.E., and afterwards came insensibly round to the south, by the E. and S.E., attended with cloudy hazy weather, and some showers of rain.

On the 10th, a little before noon, latitude 54deg, longitude 102deg 7' west, passed a small bed of sea-weed. In the afternoon the wind veered to S.W., blew a fresh gale, attended with dark cloudy weather. We steered east half a point north; and the next day, at six in the evening, being in latitude 53deg 35', longitude 95deg 52' west, the variation was 9deg 58' east. Many and various sorts of albatrosses about the ship.

On the 12th, the wind veered to the west, N.W.; and in the evening to north; and, at last, left us to a calm; that continued till midnight, when we got a breeze at south; which, soon after, veering to, and fixing at, west, we steered east; and on the 14th, in the morning, found the variation to be 13deg 25' east, latitude 53deg 25', longitude 87deg 53' west; and in the afternoon, being in the same latitude, and the longitude of 86deg 2' west, it was 15deg 3' east, and increased in such a manner, that on the 15th, in the latitude of 53deg 30', longitude 82deg 23' west, it was 17deg east; and the next evening, in the latitude of 53deg 25', longitude 78deg 40', it was 17deg 38' east. About this time, we saw a penguin and a piece of weed; and the next morning, a seal and some diving peterels. For the three last days, the wind had been at west, a steady fresh gale, attended, now and then, with showers of rain or hail.

At six in the morning of the 17th, being nearly in the same latitude as above, and in the longitude of 77deg 10' west, the variation was 18deg 33' east; and in the afternoon it was 21deg 38', being at that time in latitude 53deg 16' S., longitude 75deg 9' west. In the morning, as well as in the afternoon, I took some observations to determine the longitude by the watch; and the results, reduced to noon, gave 76deg 18' 30" west. At the same time, the longitude, by my reckoning, was 76deg 17' west. But I have reason to think, that we were about half a degree more to the west than either the one or the other; our latitude, at the same time, was 53deg 21' S.

We steered E. by N. and E. 1/2 N. all this day, under all the sail we could carry, with a fine fresh gale at N.W. by W. in expectation of seeing the land before night; but not making it till ten o'clock, we took in the studding-sails, top-gallant sails, and a reef in each top-sail, and steered E.N.E., in order to make sure of falling in with Cape Deseada.

Two hours after, we made the land, extending from N.E. by N. to E. by S. about six leagues distant. On this discovery, we wore and brought-to, with the ship's head to the south; and having sounded, found seventy-five fathoms water, the bottom stone and shells. The land now before us could be no other than the west coast of Terra del Fuego, and near

the west entrance to the Straits of Magalhaens.

As this was the first run that had been made directly across this ocean, in a high southern latitude*, I have been a little particular in noting every circumstance that appeared in the least material: and, after all, I must observe, that I never made a passage any where of such length, or even much shorter, where so few interesting circumstances occurred. For, if I except the variation of the compass, I know of nothing else worth notice. The weather had been neither unusually stormy nor cold. Before we arrived in the latitude of 50deg, the mercury in the thermometer fell gradually from sixty to fifty; and after we arrived in the latitude of 55deg, it was generally between forty-seven and forty-five; once or twice it fell to forty-three. These observations were made at noon.

[It is not to be supposed that I could know at this time, that the Adventure had made the passage before me.]

I have now done with the southern Pacific Ocean; and flatter myself that no one will think that I have left it unexplored; or that more could have been done, in one voyage, towards obtaining that end, than has been done in this.

Soon after we left New Zealand, Mr Wales contrived, and fixed up, an instrument, which very accurately measured the angle the ship rolled, when sailing large and in a great sea; and that in which she lay down, when sailing upon a wind. The greatest angle he observed her to roll was 38deg. This was on the 6th of this month, when the sea was not unusually high; so that it cannot be reckoned the greatest roll she had made. The most he observed her to heel or lie down, when sailing upon a wind, was 18deg; and this was under double-reefed top-sails and courses.

On the 18th, at three in the morning, we sounded again, and found one hundred and ten fathoms, the same bottom as before. We now made sail with a fresh gale at N.W., and steered S.E. by E. along the coast. It extended from Cape Deseada, which bore north 7deg east, to E.S.E.; a pretty high ragged isle, which lies near a league from the main, and S., 18deg E. six leagues E. from Cape Deseada, bore N. 49deg E. distant four leagues; and it obtained the name of Landfall. At four o'clock, we were north and south of the high land of Cape Deseada, distant about nine leagues; so that we saw none of the low rocks said to lie off it. The latitude of this Cape is about 53deg S., longitude 74deg 40' west.

Continuing to range the coast, at about two leagues distance, at eleven o'clock we passed a projecting point, which I called Cape Gloucester. It shews a round surface of considerable height, and has much the appearance of being an island. It lies S.S.E. 1/2 E. distant seventeen leagues from the isle of Landfall. The coast between them forms two bays, strewn with rocky islets, rocks, and breakers. The coast appeared very broken with many inlets; or rather it seemed to be composed of a number of islands. The land is very mountainous, rocky, and barren, spotted here and there with tufts of wood, and patches of snow. At noon Cape Gloucester bore north, distant eight miles, and the most advanced point of land to the S.E., which we judged to be Cape Noir, bore S.E. by S., distant seven or eight leagues. Latitude observed 54deg 13' S. Longitude, made from Cape Deseada, 54' E. From Cape Gloucester, off which lies a small rocky island, the direction of the coast is nearly S.E.; but to Cape Noir, for which we steered, the course is S.S.E., distant about ten leagues.

At three o'clock we passed Cape Noir, which is a steep rock of considerable height, and the S.W. point of a large island that seemed to lie detached, a league, or a league and a half, from the main land. The land of the cape, when at a distance from it, appeared to be an island disjoined from the other; but, on a nearer approach, we found it connected by a low neck of land. At the point of the cape are two rocks; the one peaked like a sugar-loaf, the other not so high, and shewing a rounder surface; and S. by E., two leagues from the cape, are two other rocky islets. This cape is situated in the latitude of 54deg 30' S., longitude 73deg 33' W.

After passing the two islets, we steered E.S.E., crossing the great bay of St Barbara. We but just saw the land in the bottom of it, which could not be less than seven or eight leagues from us. There was a space, lying in the direction of E.N.E. from Cape Noir, where no land was to be seen: this may be the channel of St Barbara, which opens into the straits of Magalhaens, as mentioned by Frezier. We found the cape to agree very well with his description, which shews that he laid down the channel from good memoirs. At ten o'clock, drawing near the S.E. point of the bay, which, lies nearly in the direction of S. 60deg E. from Cape Noir, eighteen leagues distant, we shortened sail, and spent the night standing off and on.

At two o'clock in the morning of the 19th, having made sail, we steered S.E. by E. along the coast, and soon passed the S.E. point of the bay of St Barbara, which I called Cape Desolation, because near it commenced the most desolate and barren country I ever saw. It is situated in the latitude of 54deg 55' S., longitude 72deg 12' W. About four leagues to the east of this cape is a deep inlet, at the entrance of which lies a pretty large island, and some others of less note. Nearly in this situation some charts place a channel leading into the straits of Magalhaens, under the name of straits of

Jelouzel. At ten o'clock, being about a league and a half from the land, we sounded, and found sixty fathoms water, a bottom of small stones and shells.

The wind, which had been fresh at N. by W., began to abate, and at noon it fell calm, when we observed in latitude 55deg 20' S., longitude made from Cape Deseada 3deg 24' E. In this situation we were about three leagues from the nearest shore, which was that of an island. This I named Gilbert Isle, after my master. It is nearly of the same height with the rest of the coast, and shews a surface composed of several peaked rocks unequally high. A little to the S.E. of it are some smaller islands, and, without them, breakers.

I have before observed that this is the most desolate coast I ever saw. It seems entirely composed of rocky mountains without the least appearance of vegetation. These mountains terminate in horrible precipices, whose craggy summits spire up to a vast height, so that hardly any thing in nature can appear with a more barren and savage aspect than the whole of this country. The inland mountains were covered with snow, but those on the sea-coast were not. We judged the former to belong to the main of Terra del Fuego, and the latter to be islands, so ranged as apparently to form a coast.

After three hours calm we got a breeze at S.E. by E., and having made a short trip to south, stood in for the land; the most advanced point of which, that we had in sight, bore east, distant ten leagues. This is a lofty promontory, lying E.S.E, nineteen leagues from Gilbert isle, and situated in latitude 55deg 26' S, longitude 70deg 25' W. Viewed from the situation we now were in, it terminated in two high towers; and, within them, a hill shaped like a sugar-loaf. This wild rock, therefore, obtained the name of York Minster. Two leagues to the westward of this head appeared a large inlet, the west point of which we fetched in with by nine o'clock, when we tacked in forty-one fathoms water, half a league from the shore; to the westward of this inlet was another, with several islands lying in the entrance.

During the night between the 19th and 20th we had little wind easterly, which in the morning veered to N.E. and N.N.E., but it was too faint to be of use; and at ten we had a calm, when we observed the ship to drive from off the shore out to sea. We had made the same observation the day before. This must have been occasioned by a current; and the melting of the snow increasing, the inland waters will cause a stream to run out of most of these inlets. At noon we observed in latitude 55deg 39' 30" S., York Minster then bearing N. 15deg E., distant five leagues; and Round-hill, just peeping above the horizon, which we judged to belong to the isles of St Ildefonso, E. 25deg S., ten or eleven leagues distant. At ten o'clock, a breeze springing up at E. by S., I took this opportunity to stand in for the land, being desirous of going into one of the many ports which seemed open to receive us, in order to take a view of the country, and to recruit our stock of wood and water.

In standing in for an opening, which appeared on the east side of York Minster, we had forty, thirty-seven, fifty, and sixty fathoms water, a bottom of small stones and shells. When we had the last soundings, we were nearly in the middle between the two points that form the entrance to the inlet, which we observed to branch into two arms, both of them lying in nearly north, and disjoined by an high rocky point. We stood for the eastern branch as being clear of islets; and after passing a black rocky one, lying without the point just mentioned, we sounded, and found no bottom with a line of an hundred and seventy fathoms. This was altogether unexpected, and a circumstance that would not have been regarded if the breeze had continued; but at this time it fell calm, so that it was not possible to extricate ourselves from this disagreeable situation. Two boats were hoisted out, and sent a-head to tow; but they would have availed little, had not a breeze sprung up about eight o'clock at S.W., which put it in my power either to stand out to sea, or up the inlet. Prudence seemed to point out the former, but the desire of finding a good port, and of learning something of the country, getting the better of every other consideration, I resolved to stand in; and, as night was approaching, our safety depended on getting to an anchor. With this view we continued to sound, but always had an unfathomable depth.

Hauling up under the east side of the land which divided the two arms, and seeing a small cove ahead, I sent a boat to sound; and we kept as near the shore as the flurries from the land would permit, in order to be able to get into this place, if there should be anchorage. The boat soon returned, and informed us that there was thirty and twenty-five fathoms water, a full cable's length from the shore; here we anchored in thirty fathoms, the bottom sand and broken shells; and carried out a kedge and hawser to steady the ship for the night.

CHAPTER II.

Transactions in Christmas Sound, with an Account of the Country and its Inhabitants.

1774 December

The morning of the 21st was calm and pleasant. After breakfast I set out with two boats to look for a more secure station. We no sooner got round, or above the point, under which the ship lay, than we found a cove in which was anchorage in thirty, twenty, and fifteen fathoms, the bottom stones and sand. At the head of the cove was a stony beach, a valley covered with wood, and a stream of fresh water, so that there was every thing we could expect to find in such a place, or rather more; for we shot three geese out of four that we saw, and caught some young ones, which we afterwards let go.

After discovering and sounding this cove, I sent Lieutenant Clerke, who commanded the other boat, on board, with orders to remove the ship into this place, while I proceeded farther up the inlet. I presently saw that the land we were under, which disjoined the two arms, as mentioned before, was an island, at the north end of which the two channels united. After this I hastened on board, and found every thing in readiness to weigh, which was accordingly done, and all the boats sent ahead to tow the ship round the point. But at that moment a light breeze came in from the sea too scant to fill our sails, so that we were obliged to drop the anchor again, for fear of falling upon the point, and to carry out a kedge to windward. That being done, we hove up the anchor, warped up to, and weighed the kedge, and proceeding round the point under our stay-sails; there anchored with the best bower in twenty fathoms; and moored with the other bower, which lay to the north, in thirteen fathoms. In this position we were shut in from the sea by the point above-mentioned, which was in one with the extremity of the inlet to the east. Some islets, off the next point above us, covered us from the N.W., from which quarter the wind had the greatest fetch, and our distance from the shore was about one-third of a mile.

Thus situated we went to work, to clear a place to fill water, to cut wood, and to set up a tent for the reception of a guard, which was thought necessary, as we had already discovered that, barren as this country is, it was not without people, though we had not yet seen any. Mr Wales also got his observatory and instruments on shore; but it was with the greatest difficulty he could find a place of sufficient stability, and clear of the mountains, which every where surrounded us, to set them up in; and at last he was obliged to content himself with the top of a rock not more than nine feet over.

Next day I sent Lieutenants Clerke and Pickersgill, accompanied by some of the other officers, to examine and draw a sketch of the channel on the other side of the island; and I went myself in another boat, accompanied by the botanists, to survey the northern parts of the sound. In my way I landed on the point of a low isle covered with herbage, part of which had been lately burnt: We likewise saw a hut, signs sufficient that people were in the neighbourhood. After I had taken the necessary bearings, we proceeded round the east end of Burnt Island, and over to what we judged to be the main of Terra del Fuego, where we found a very fine harbour encompassed by steep rocks of vast height, down which ran many limpid streams of water; and at the foot of the rocks some tufts of trees, fit for little else but fuel.

This harbour, which I shall distinguish by the name of the Devil's Bason, is divided, as it were, into two, an inner and an outer one; and the communication between them is by a narrow channel five fathoms deep. In the outer bason I found thirteen and seventeen fathoms water, and in the inner seventeen and twenty-three. This last is as secure a place as can be, but nothing can be more gloomy. The vast height of the savage rocks which encompass it, deprived great part of it, even on this day, of the meridian sun. The outer harbour is not quite free from this inconvenience, but far more so than the other; it is also rather more commodious, and equally safe. It lies in the direction of north, a mile and a half distant from the east end of Burnt Island. I likewise found a good anchoring-place a little to the west of this harbour, before a stream of water, that comes out of a lake or large reservoir, which is continually supplied by a cascade falling into it.

Leaving this place, we proceeded along the shore to the westward, and found other harbours which I had not time to look into. In all of them is fresh water, and wood for fuel; but, except these little tufts of bushes, the whole country is a barren rock, doomed by nature to everlasting sterility. The low islands, and even some of the higher, which lie scattered up and down the sound, are indeed mostly covered with shrubs and herbage, the soil a black rotten turf, evidently composed, by length of time, of decayed vegetables.

I had an opportunity to verify what we had observed at sea, that the sea-coast is composed of a number of large and small islands, and that the numerous inlets are formed by the junction of several channels; at least so it is here. On one of these low islands we found several huts, which had lately been inhabited; and near them was a good deal of celery, with which we loaded our boat, and returned on board at seven o'clock in the evening. In this expedition we met with little game; one duck, three or four shags, and about that number of rails or sea-pies, being all we got. The other boat returned on board some hours before, having found two harbours on the west side of the other channel; the one large, and the other small, but both of them safe and commodious; though, by the sketch Mr Pickersgill had taken of them, the access to both appeared rather intricate.

I was now told of a melancholy accident which had befallen one of our marines. He had not been seen since eleven or

twelve o'clock the preceding night. It was supposed that he had fallen overboard, out of the head, where he had been last seen, and was drowned.

Having fine pleasant weather on the 23d, I sent Lieutenant Pickersgill in the cutter to explore the east side of the sound, and went myself in the pinnace to the west side, with an intent to go round the island, under which we were at anchor (and which I shall distinguish by the name of Shag Island), in order to view the passage leading to the harbours Mr Pickersgill had discovered the day before, on which I made the following observations. In coming from sea, leave all the rocks and islands, lying off and within York Minster, on your larboard side; and the black rock, which lies off the south end of Shag Island, on your starboard; and when abreast of the south end of that island, haul over for the west shore, taking care to avoid the beds of weeds you will see before you, as they always grow on rocks; some of which I have found twelve fathoms under water; but it is always best to keep clear of them. The entrance to the large harbour, or Port Clerke, is just to the north of some low rocks lying off a point on Shag Island. This harbour lies in W. by S., a mile and a half, and hath in it from twelve to twenty-four fathoms depth, wood and fresh water. About a mile without, or to the southward of Port Clerke, is, or seemed to be, another which I did not examine. It is formed by a large island which covers it from the south and east winds. Without this island, that is, between it and York Minster, the sea seemed strewn with islets, rocks, and breakers. In proceeding round the south end of Shag Island, we observed the shags to breed in vast numbers in the cliffs of the rock. Some of the old ones we shot, but could not come at the young ones, which are by far the best eating. On the east side of the island we saw some geese; and having with difficulty landed, we killed three, which, at this time, was a valuable acquisition.

About seven, in the evening, we got on board, where Mr Pickersgill had arrived but just before. He informed me that the land opposite to our station was an island, which he had been round; that on another, more to the north, he found many *terns* eggs; and that without the great island, between it and the east-head, lay a cove in which were many geese; one only of which he got, beside some young goslings.

This information of Mr Pickersgill's induced me to make up two shooting parties next day; Mr Pickersgill and his associates going in the cutter, and myself and the botanists in the pinnace. Mr Pickersgill went by the N.E. side of the large island above-mentioned, which obtained the name of Goose Island; and I went by the S.W. side. As soon as we got under the island we found plenty of shags in the cliffs, but, without staying to spend our time and shot upon these, we proceeded on, and presently found sport enough, for in the south side of the island were abundance of geese. It happened to be the moulting season; and most of them were on shore for that purpose, and could not fly. There being a great surf, we found great difficulty in landing, and very bad climbing over the rocks when we were landed; so that hundreds of the geese escaped us, some into the sea, and others up into the island. We, however, by one means or other, got sixty-two, with which we returned on board all heartily tired; but the acquisition we had made overbalanced every other consideration, and we sat down with a good appetite to supper on part of what the preceding day had produced. Mr Pickersgill and his associates had got on board some time before us with fourteen geese; so that I was able to make distribution to the whole crew, which was the more acceptable on account of the approaching festival. For had not Providence thus singularly provided for us, our Christmas cheer must have been salt beef and pork.

I now learnt that a number of the natives, in nine canoes, had been alongside the ship, and some on board. Little address was required to persuade them to either; for they seemed to be well enough acquainted with Europeans, and had, amongst them, some of their knives.

The next morning, the 25th, they made us another visit. I found them to be of the same nation I had formerly seen in Success Bay, and the same which M. de Bougainville distinguishes by the name of Pecheras; a word which these had, on every occasion, in their mouths. They are a little, ugly, half-starved, beardless race. I saw not a tall person amongst them. They are almost naked; their clothing was a seal-skin; some had two or three sewed together, so as to make a cloak which reached to the knees; but the most of them had only one skin, hardly large enough to cover their shoulders, and all their lower parts were quite naked. The women, I was told, cover their nakedness with the flap of a seal-skin, but in other respects are clothed like the men. They, as well as the children, remained in the canoes. I saw two young children at the breast entirely naked; thus they are inured from their infancy to cold and hardships. They had with them bows and arrows, and darts, or rather harpoons, made of bone, and fitted to a staff. I suppose they were intended to kill seals and fish; they may also kill whales with them, as the Esquimaux do. I know not if they resemble them in their love of train-oil; but they and every thing they had smelt most intolerably of it. I ordered them some biscuit, but did not observe them so fond of it as I had been told. They were much better pleased when I gave them some medals, knives, etc.

The women and children, as before observed, remained in their canoes. These were made of bark; and in each was a fire, over which the poor creatures huddled themselves. I cannot suppose that they carry a fire in their canoes for this purpose only, but rather that it may be always ready to remove ashore wherever they land; for let their method of

obtaining fire be what it may, they cannot be always sure of finding dry fuel that will kindle from a spark. They likewise carry in their canoes large seal hides, which I judged were to shelter them when at sea, and to serve as covering to their huts on shore, and occasionally to be used for sails.

They all retired before dinner, and did not wait to partake of our Christmas cheer. Indeed I believe no one invited them, and for good reasons; for their dirty persons, and the stench they carried about them, were enough to spoil the appetite of any European; and that would have been a real disappointment, as we had not experienced such fare for some time. Roast and boiled geese, goose-pye, etc. was a treat little known to us; and we had yet some Madeira wine left, which was the only article of our provision that was mended by keeping. So that our friends in England did not, perhaps, celebrate Christmas more cheerfully than we did.

On the 26th, little wind next to a calm, and fair weather, except in the morning, when we had some showers of rain. In the evening, when it was cold, the natives made us another visit; and it being distressing to see them stand trembling and naked on the deck, I could not do less than give them some baize and old canvas to cover themselves.

Having already completed our water, on the 27th I ordered the wood, tent, and observatory to be got on board; and, as this was work for the day, a party of us went in two boats to shoot geese, the weather being fine and pleasant. We proceeded round by the south side of Goose Island, and picked up in all thirty-one. On the east side of the island, to the north of the east point, is good anchorage, in seventeen fathoms water, where it is entirely land-locked. This is a good place for ships to lie in that are bound to the west. On the north side of this isle I observed three fine coves, in which were both wood and water; but it being near night, I had no time to sound them, though I doubt not there is anchorage. The way to come at them is by the west end of the island.

When I returned on board I found every thing got off the shore, and the launch in; so that we now only waited for a wind to put to sea. The festival, which we celebrated at this place, occasioned my giving it the name of Christmas Sound. The entrance, which is three leagues wide, is situated in the latitude of 55deg 27' S., longitude 70deg 16' W.; and in the direction of N. 37deg W. from St Ildefonso Isles, distant ten leagues. These isles are the best landmark for finding the sound. York Minster, which is the only remarkable land about it, will hardly be known by a stranger, from any description that can be given of it, because it alters its appearance according to the different situations it is viewed from. Besides the black rock, which lies off the end of Shag Island, there is another about midway between this and the east shore. A copious description of this sound is unnecessary, as few would be benefited by it. Anchorage, tufts of wood, and fresh-water, will be found in all the coves and harbours. I would advise no one to anchor very near the shore for the sake of having a moderate depth of water, because there I generally found a rocky bottom.

The refreshments to be got here are precarious, as they consist chiefly of wild fowl, and may probably never be found in such plenty as to supply the crew of a ship; and fish, so far as we can judge, are scarce. Indeed the plenty of wild-fowl made us pay less attention to fishing. Here are, however, plenty of muscles, not very large, but well tasted; and very good celery is to be met with on several of the low islets, and where the natives have their habitations. The wild-fowl are geese, ducks, sea-pies, shags, and that kind of gull so often mentioned in this journal under the name of Port Egmont hen. Here is a kind of duck, called by our people race-horses, on account of the great swiftness with which they run on the water; for they cannot fly, the wings being too short to support the body in the air. This bird is at the Falkland Islands, as appears by Pernety's Journal*. The geese too are there, and seem to be very well described under the name of bustards. They are much smaller than our English tame geese, but eat as well as any I ever tasted. They have short black bills and yellow feet. The gander is all white; the female is spotted black and white, or grey, with a large white spot on each wing. Besides the bird above-mentioned, here are several other aquatic, and some land ones; but of the latter not many.

[* See Pernety's Journal, p.244 and p.213.]

From the knowledge which the inhabitants seem to have of Europeans, we may suppose that they do not live here continually, but retire to the north during the winter. I have often wondered that these people do not clothe themselves better, since Nature has certainly provided materials. They might line their seal-skin cloaks with the skins and feathers of aquatic birds; they might make their cloaks larger, and employ the same skins for other parts of clothing, for I cannot suppose they are scarce with them. They were ready enough to part with those they had to our people, which they hardly would have done, had they not known where to have got more. In short, of all the nations I have seen, the Pecheras are the most wretched. They are doomed to live in one of the most inhospitable climates in the world, without having sagacity enough to provide themselves with such conveniences as may render life in some measure more comfortable.

Barren as this country is, it abounds with a variety of unknown plants, and gave sufficient employment to Mr Forster

and his party. The tree, which produceth the winter's bark; is found here in the woods, as is the holy-leaved barberry; and some other sorts, which I know not, but I believe are common in the straits of Magalhaens. We found plenty of a berry, which we called the cranberry, because they are nearly of the same colour, size, and shape. It grows on a bushy plant, has a bitterish taste, rather insipid; but may be eaten either raw or in tarts, and is used as food by the natives.

CHAPTER III.

Range from Christmas Sound, round Cape Horn, through Strait Le Maire, and round Staten Land; with an Account of the Discovery of a Harbour in that Island, and a Description of the Coasts.

1774 December

At four o'clock in the morning on the 28th, we began to unmoor, and at eight weighed, and stood out to sea, with a light breeze at N.W., which afterwards freshened, and was attended with rain. At noon, the east point of the sound (Point Nativity) bore N. 1/2 W., distant one and a half leagues, and St Ildefonso Isles S.E. 1/2 S., distant seven leagues. The coast seemed to trend in the direction of E. by S.; but the weather being very hazy, nothing appeared distinct.

We continued to steer S.E. by E. and E.S.E.; with a fresh breeze at W.N.W., till four o'clock p.m., when we hauled to the south, in order to have a nearer view of St Ildefonso Isles. At this time we were abreast of an inlet, which lies E.S.E., about seven leagues from the sound; but it must be observed that there are some isles without this distinction. At the west point of the inlet are two high peaked hills, and below them, to the east, two round hills, or isles, which lie in the direction of N.E. and S.W. of each other. An island, or what appeared to be an island, lay in the entrance; and another but smaller inlet appeared to the west of this: Indeed the coast appeared indented and broken as usual.

At half past five o'clock, the weather clearing up, gave us a good sight of Ildefonso Isles. They are a group of islands and rocks above water, situated about six leagues from the main, and in the latitude of 55deg 53' S., longitude 69deg 41' W.

We now resumed our course to the east, and, at sun-set, the most advanced land bore S.E. by E. 3/4 E.; and a point, which I judged to be the west point of Nassau Bay, discovered by the Dutch fleet under the command of Admiral Hermite in 1624, bore N. 80deg E., six leagues distant. In some charts this point is called False Cape Horn, as being the southern point of Terra del Fuego. It is situated in latitude 55deg 39' S. From the inlet above-mentioned to this false cape, the direction of the coast is nearly east, half a point south, distant fourteen or fifteen leagues.

At ten o'clock, having shortened sail, we spent the night in making short boards under the top-sails, and at three next morning made sail, and steered S.E. by S., with a fresh breeze at W.S.W., the weather somewhat hazy. At this time the west entrance to Nassau Bay extended from N. by E. to N.E. 1/2 E., and the south side of Hermite's Isles, E. by S. At four, Cape Horn, for which we now steered, bore E. by S. It is known, at a distance, by a high round hill over it. A point to the W.N.W. shews a surface not unlike this; but their situations alone will always distinguish the one from the other.

At half past seven, we passed this famous *cape*, and entered the southern Atlantic ocean. It is the very same point of land I took for the cape, when I passed it in 1769, which at that time I was doubtful of. It is the most southern extremity on a group of islands of unequal extent, lying before Nassau Bay, known by the name of Hermite Islands, and is situated in the latitude of 55deg 58', and in the longitude of 68deg 13' W.; according to the observations made of it in 1769. But the observations which we had in Christmas Sound, and reduced to the cape by the watch, and others which we had afterwards, and reduced back to it by the same means, place it in 67deg 19'. It is most probable that a mean between the two, viz. 67deg 46', will be nearest the truth. On the N.W. side of the cape are two peaked rocks, like sugar-loaves: They lie N.W. by N., and S.E. by S., by compass, of each other. Some other straggling low rocks lie west of the cape, and one south of it; but they are all near the shore. From Christmas Sound to Cape Horn the course is E.S.E. 1/4 E., distant thirty-one leagues. In the direction of E.N.E., three leagues from Cape Horn, is a rocky point, which I called Mistaken Cape, and is the southern point of the easternmost of Hermite Isles. Between these two capes there seemed to be a passage directly into Nassau Bay; some small isles were seen in the passage; and the coast, on the west side, had the appearance of forming good bays or harbours. In some charts, Cape Horn is laid down as belonging to a small island. This was neither confirmed, nor can it be contradicted by us; for several breakers appeared on the coast, both to the east and west of it; and the hazy weather rendered every object indistinct. The summits of some of the hills were rocky, but the sides and vallies seemed covered with a green turf, and wooded in tufts.

From Cape Horn we steered E. by N. 1/2 N., which direction carried us without the rocks that lie off Mistaken Cape. These rocks are white with the dung of fowls, and vast numbers were seen about them. After passing them we steered N.E. 1/2 E. and N.E., for Strait Le Maire, with a view of looking into Success Bay, to see if there were any traces of the

Adventure having been there. At eight o'clock in the evening, drawing near the strait, we shortened sail, and hauled the wind. At this time the Sugar-loaf on Terra del Fuego bore N. 33deg W.; the point of Success Bay, just open of the cape of the same name, bearing N. 20deg E.; and Staten Land, extending from N. 53deg E. to 67deg E. Soon after the wind died away, and we had light airs and calms by turns till near noon the next day, during which time we were driven by the current over to Staten Land.

The calm being succeeded by a light breeze at N.N.W., we stood over for Success Bay, assisted by the currents, which set to the north. Before this we had hoisted our colours, and fired two guns; and soon after saw a smoke rise out of the woods, above the south point of the bay, which I judged was made by the natives, as it was at the place where they resided when I was here in 1769. As soon as we got off the bay, I sent Lieutenant Pickersgill to see if any traces remained of the Adventure having been there lately; and in the mean time we stood on and off with the ship. At two o'clock, the current turned and set to the south; and Mr Pickersgill informed me, when he returned, that it was falling water on shore, which was contrary to what I had observed when I was here before, for I thought then that the flood came from the north. Mr Pickersgill saw not the least signs of any ship having been there lately. I had inscribed our ship's name on a card, which he nailed to a tree at the place where the Endeavour watered. This was done with a view of giving Captain Furneaux some information, in case he should be behind us and put in here.

On Mr Pickersgill's landing he was courteously received by several of the natives, who were clothed in guanicoe and seal skins, and had on their arms bracelets, made of silver wire, and wrought not unlike the hilt of a sword, being no doubt the manufacture of some Europeans. They were the same kind of people we had seen in Christmas Sound, and, like them, repeated the word pechera on every occasion. One man spoke much to Mr Pickersgill, pointing first to the ship and then to the bay, as if he wanted her to come in. Mr Pickersgill said the bay was full of whales and seals; and we had observed the same in the strait, especially on the Terra del Fuego side, where the whales, in particular, are exceedingly numerous.

As soon as the boat was hoisted in, which, was not till near six o'clock, we made sail to the east, with a fine breeze at north. For since we had explored the south coast of Terra del Fuego, I resolved to do the same by Staten Land, which I believed to have been as little known as the former. At nine o'clock the wind freshening, and veering to N.W., we tacked, and stood to S.W., in order to spend the night; which proved none of the best, being stormy and hazy, with rain.

Next morning, at three o'clock, we bore up for the east end of Staten Land, which, at half past four, bore S. 60deg E., the west end S. 2deg E., and the land of Terra del Fuego S. 40deg W. Soon after I had taken these bearings, the land was again obscured in a thick haze, and we were obliged to make way, as it were, in the dark; for it was but now and then we got a sight of the coast. As we advanced to the east, we perceived several islands, of unequal extent, lying off the land. There seemed to be a clear passage between the easternmost, and the one next to it, to the west. I would gladly have gone through this passage, and anchored under one of the islands, to have waited for better weather, for on sounding we found only twenty-nine fathoms water; but when I considered that this was running to leeward in the dark, I chose to keep without the islands, and accordingly hauled off to the north. At eight o'clock we were abreast of the most eastern isle, distant from it about two miles, and had the same depth of water as before. I now shortened sail to the three top-sails, to wait for clear weather; for the fog was so thick that we could see no other land than this island. After waiting an hour, and the weather not clearing, we bore up and hauled round the east end of the island, for the sake of smooth water and anchorage, if it should be necessary. In hauling round, we found a strong race of a current, like unto broken water; but we had no less than nineteen fathoms. We also saw on the island abundance of seals and birds. This was a temptation too great for people in our situation to withstand, to whom fresh provisions of any kind were acceptable; and determined me to anchor, in order that we might taste of what we now only saw at a distance. At length, after making a few boards, fishing, as it were, for the best ground, we anchored in twenty-one fathoms water, a stony bottom, about a mile from the island, which extended from N. 18deg E. to N. 55deg 1/2 W.; and soon after, the weather clearing up, we saw Cape St John, or the east end of Staten Land, bearing S. 76deg E., distant four leagues. We were sheltered from the south wind by Staten Land, and from the north wind by the island; the other isles lay to the west, and secured us from that wind; but beside being open to the N.E. and E., we also lay exposed to the N.N.W. winds. This might have been avoided by anchoring more to the west, but I made choice of my situation for two reasons; first, to be near the island we intended to land upon, and, secondly, to be able to get to sea with any wind.

After dinner we hoisted out three boats, and landed with a large party of men; some to kill seals, others to catch or kill birds, fish, or what came in our way. To find the former it mattered not where we landed, for the whole shore was covered with them; and by the noise they made one would have thought the island was stocked with cows and calves. On landing we found they were a different animal from seals, but in shape and motion exactly resembling them. We called them lions, on account of the great resemblance the male has to that beast. Here were also the same kind of seals which we found in New Zealand, generally known by the name of sea-bears; at least we gave them that name.

They were, in general, so tame, or rather stupid, as to suffer us to come near enough to knock them down with sticks; but the large ones we shot, not thinking it safe to approach them. We also found on the island abundance of penguins and shags; and the latter had young ones almost fledged, and just to our taste. Here were geese and ducks, but not many; birds of prey, and a few small birds. In the evening we returned on board, our boats well laden with one thing or other.

1775 January

Next day, being January the 1st, 1775, finding that nothing was wanting but a good harbour to make this a tolerable place for ships to refresh at, whom chance or design, might bring hither, I sent Mr Gilbert over to Staten Land in the cutter to look for one. Appearances promised success in a place opposite the ship. I also sent two other boats for the lions, etc. we had killed the preceding day; and soon after I went myself, and observed the sun's meridian altitude at the N.E. end of the island, which gave the latitude 54deg 40' 5" S. After shooting a few geese, some other birds, and plentifully supplying ourselves with young shags, we returned on board, laden with sea-lions, sea-bears, etc. The old lions and bears were killed chiefly for the sake of their blubber, or fat, to make oil of; for, except their haslets, which were tolerable, the flesh was too rank to be eaten with any degree of relish. But the young cubs were very palatable, and even the flesh of some of the old lionesses was not much amiss, but that of the old males was abominable. In the afternoon I sent some people on shore to skin and cut off the fat of those which yet remained dead on shore, for we had already more carcasses on board than necessary; and I went myself, in another boat, to collect birds. About ten o'clock Mr Gilbert returned from Staten Land, where he found a good port, situated three leagues to the westward of Cape St John, and in the direction of north, a little easterly, from the N.E. end of the eastern island. It may be known by some small islands lying in the entrance. The channel, which is on the east side of these islands, is half a mile broad. The course is in S.W. by S., turning gradually to W. by S. and W. The harbour lies nearly in this last direction; is almost two miles in length; in some places near a mile broad; and hath in it from fifty to ten fathoms water, a bottom of mud and sand. Its shores are covered with wood fit for fuel; and in it are several streams of fresh water. On the islands were sea-lions, etc. and such an innumerable quantity of gulls as to darken the air when disturbed, and almost to suffocate our people with their dung. This they seemed to void in a way of defence, and it stunk worse than assafoetida, or what is commonly called devil's dung. Our people saw several geese, ducks, and race-horses, which is also a kind of duck. The day on which this port was discovered occasioned my calling it New-Year's Harbour. It would be more convenient for ships bound to the west, or round Cape Horn, if its situation would permit them to put to sea with an easterly and northerly wind. This inconvenience, however, is of little consequence, since these winds are never known to be of long duration. The southerly and westerly are the prevailing winds, so that a ship never can be detained long in this port.

As we could not sail in the morning of the 2d for want of wind, I sent a party of men on shore to the island, on the same duty as before. Towards noon we got a fresh breeze at west; but it came too late, and I resolved to wait till the next morning, when, at four o'clock, we weighed, with a fresh gale at N.W. by W., and stood for Cape St John, which, at half past six, bore N. by E., distant four or five miles. This cape, being the eastern point of Staten Land, a description of it is unnecessary. It may, however, not be amiss to say, that it is a rock of a considerable height, situated in the latitude of 54deg 46' S., longitude 63deg 47' W., with a rocky islet lying close under the north part of it. To the westward of the cape, about five or six miles, is an inlet, which seemed to divide the land, that is, to communicate with the sea to the south; and between this inlet and the cape is a bay, but I cannot say of what depth. In sailing round the cape we met with a very strong current from the south: It made a race which looked like breakers; and it was as much as we could do, with a strong gale, to make head against it.

After getting round the cape, I hauled up along the south coast, and as soon as we had brought the wind to blow off the land, it came upon us in such heavy squalls as obliged us to double-reef our top-sails. It afterwards fell, by little and little, and at noon ended in a calm. At this time Cape St John bore N. 20deg E., distant three and a half leagues; Cape St Bartholomew, or the S.W. point of Staten Land, S. 83deg W.; two high detached rocks N. 80deg W.; and the place where the land seemed to be divided, which had the same appearance on this side, bore N. 15deg W. three leagues distant. Latitude observed 54deg 56'. In this situation we sounded, but had no bottom with a line of 120 fathoms. The calm was of very short duration, a breeze presently springing up at N.W.; but it was too faint to make head against the current, and we drove with it back to the N.N.E. At four o'clock the wind veered, at once, to S. by E., and blew in squalls attended with rain. Two hours after, the squalls and rain subsided, and the wind returning back to the west, blew a gentle gale. All this time the current set us to the north, so that, at eight o'clock, Cape St John bore W.N.W., distant about seven leagues. I now gave over plying, and steered S.E., with a resolution to leave the land; judging it to be sufficiently explored to answer the most general purposes of navigation and geography.

CHAPTER IV.

Observations, geographical and nautical, with an Account of the Islands near Staten Land, and the Animals found in

them.

1775 January

The annexed chart will very accurately shew the direction, extent, and position of the coast, along which I have sailed, either in this or my former voyage. The latitudes have been determined by the sun's meridian altitude, which we were so fortunate as to obtain every day, except the one we sailed from Christmas Sound, which was of no consequence, as its latitude was known before. The longitudes have been settled by lunar observations, as is already mentioned. I have taken 67deg 46' for the longitude of Cape Horn. From this meridian the longitudes of all the other parts are deduced by the watch, by which the extent of the whole must be determined to a few miles; and whatever errors there may be in longitude, must be general. But I think it highly probable that the longitude is determined to within a quarter of a degree. Thus the extent of Terra del Fuego from east to west, and consequently that of the straits of Magalhaens, will be found less than most navigators have made it.

In order to illustrate this and to shew the situations of the neighbouring lands, and, by this means, make the chart of more general use, I have extended it down to 47deg of latitude. But I am only answerable for the accuracy of such parts as I have explored myself. In laying down the rest I had recourse to the following authorities.

The longitude of Cape Virgin Mary, which is the most essential point, as it determines the length of the straits of Magalhaens, is deduced from Lord Anson, who made 2deg 30' difference of longitude between it and the Strait Le Maire. Now as the latter lies in 65deg 22', Cape Virgin-Mary must lie in: 67deg 52', which is the longitude I have assigned to it, and which, I have reason to think, cannot be far from the truth.

The strait of Magalhaens, and the east coast of Patagonia, are laid down from the observations made by the late English and French navigators.

The position of the west coast of America, from Cape Victory northward, I have taken from the discoveries of *Sarmiento*, a Spanish navigator, communicated to me by Mr Stuart, F.R.S.

Falkland Islands are copied from a sketch taken from Captain M'Bride, who circumnavigated them some years ago in his majesty's ship Jason; and their distance from the main is agreeable to the run of the Dolphin, under the command of Commodore Byron, from Cape Virgin Mary to Port Egmont, and from Port Egmont to Port Desire, both of which runs were made in a few days; consequently no material errors could happen.

The S.W. coast of Terra del Fuego, with respect to inlets, islands, etc. may be compared to the coast of Norway; for I doubt if there be an extent of three leagues where there is not an inlet or harbour which will receive and shelter the largest shipping. The worst is, that till these inlets are better known, one has, as it were, to fish for anchorage. There are several lurking rocks on the coast, but happily none of them lie far from land, the approach to which may be known by sounding, supposing the weather so obscure that you cannot see it. For to judge of the whole by the parts we have sounded, it is more than probable that there are soundings all along the coast, and for several leagues out to sea. Upon the whole, this is by no means the dangerous coast it has been represented.

Staten Land lies near E. by N. and W. by S., and is ten leagues long in that direction, and no where above three or four leagues broad. The coast is rocky, much indented, and seemed to form several bays or inlets. It shews a surface of craggy hills which spire up to a vast height, especially near the west end. Except the craggy summits of the hills, the greatest part was covered with trees and shrubs, or some sort of herbage, and there was little or no snow on it. The currents between Cape Deseada and Cape Horn set from west to east, that is, in the same direction as the coast; but they are by no means considerable. To the east of the cape their strength is much increased, and their direction is N.E. towards Staten Land. They are rapid in Strait Le Maire and along the south coast of Staten Land, and set like a torrent round Cape St John; where they take a N.W. direction, and continue to run very strong both within and without New Year's Isles. While we lay at anchor within this island, I observed that the current was strongest during the flood; and that on the ebb its strength was so much impaired, that the ship would sometimes ride head to the wind when it was at W. and W.N.W. This is only to be understood of the place where the ship lay at anchor, for at the very time we had a strong current setting to the westward, Mr Gilbert found one of equal strength near the coast of Staten Land setting to the eastward, though probably this was an eddy current or tide.

If the tides are regulated by the moon, it is high-water by the shore at this place on the days of the new and full moon, about four o'clock. The perpendicular rise and fall is very inconsiderable, not exceeding four feet at most. In Christmas Sound it is high-water at half past two o'clock on the days of the full and change, and Mr Wales observed it to rise and fall on a perpendicular three feet six inches; but this was during the neap tides, consequently the spring tides must rise higher. To give such an account of the tides and currents on these coasts as navigators might depend on, would

require a multitude of observations, and in different places, the making of which would be a work of time. I confess myself unprovided with materials for such a task; and believe that the less I say on this subject the fewer mistakes I shall make. But I think I have been able to observe, that in Strait Le Maire the southerly tide or current, be it flood or ebb, begins to act on the days of new and full moon about four o'clock, which remark may be of use to ships who pass the strait.

Were I bound round Cape Horn to the west, and not in want of wood or water, or any other thing that might make it necessary to put into port, I would not come near the land at all. For by keeping out at sea you avoid the currents, which, I am satisfied, lose their force at ten or twelve leagues from land; and at a greater distance, there is none.

During the time we were upon the coast we had more calms than storms, and the winds so variable, that I question if a passage might not have been made from east to west in as short a time as from west to east; nor did we experience any cold weather. The mercury in the thermometer at noon was never below 46deg; and while we lay in Christmas Sound it was generally above temperate. At this place the variation was 23deg 30' E.; a few leagues to the S. W. of Strait Le Maire it was 24deg; and at anchor, within New Year's Isles, it was 24deg 20' E.

These isles are, in general, so unlike Staten Land, especially the one on which we landed, that it deserves a particular description. It shews a surface of equal height, and elevated about thirty or forty feet above the sea, from which it is defended by a rocky coast. The inner part of the isle is covered with a sort of sword-grass, very green, and of a great length. It grows on little hillocks of two or three feet in diameter, and as many or more in height, in large tufts, which seemed to be composed of the roots of the plant matted together. Among these hillocks are a vast number of paths made by sea-bears and penguins, by which they retire into the centre of the isle. It is, nevertheless, exceedingly bad travelling; for these paths are so dirty that one is sometimes up to the knees in mire. Besides this plant, there are a few other grasses, a kind of heath, and some celery. The whole surface is moist and wet, and on the coast are several small streams of water. The sword-grass, as I call it, seems to be the same that grows in Falkland Isles, described by Bougainville as a kind of *gladiolus*, or rather a species of *gramen** and named by Pernety corn-flags.

[See English translation of Bougainville, p.51.]

The animals found on this little spot are sea-lions, sea-bears, a variety of oceanic, and some land-birds. The sea-lion is pretty well described by Pernety, though those we saw here have not such fore-feet or fins as that he has given a plate of, but such fins as that which he calls the sea-wolf. Nor did we see any of the size he speaks of, the largest not being more than twelve or fourteen feet in length, and perhaps eight or ten in circumference. They are not of that kind described under the same name by Lord Anson; but, for aught I know, these would more properly deserve that appellation: The long hair, with which the back of the head, the neck and shoulders, are covered, giving them greatly the air and appearance of a lion. The other part of the body is covered with short hair, little longer than that of a cow or a horse, and the whole is a dark-brown. The female is not half so big as the male, and is covered with a short hair of an ash or light-dun colour. They live, as it were, in herds, on the rocks, and near the sea-shore. As this was the time for engendering as well as bringing forth their young, we have seen a male with twenty or thirty females about him, and always very attentive to keep them all to himself, and beating off every other male who attempted to come into his flock. Others again had a less number; some no more than one or two; and here and there we have seen one lying growling in a retired, place, alone, and suffering neither males nor females to approach him: We judged these were old and superannuated.

The sea-bears are not so large, by far, as the lions, but rather larger than a common seal. They have none of that long hair which distinguishes the lion. Theirs is all of an equal length, and finer than that of the lion, something like an otter's, and the general colour is that of an iron-grey. This is the kind which the French call sea-wolves, and the English seals; they are, however, different from the seals we have in Europe and North America. The lions may, too, without any great impropriety, be called over-grown seals; for they are all of the same species. It was not at all dangerous to go among them, for they either fled or lay still. The only danger was in going between them and the sea; for if they took fright at any thing, they would come down in such numbers, that, if you could not get out of their way, you would be run over. Sometimes, when we came suddenly upon them, or waked them out of their sleep, (for they are a sluggish sleepy animal), they would raise up their heads; snort and snarl, and look as fierce as if they meant to devour us; but as we advanced upon them they always run away, so that they are downright bullies.

The penguin is an amphibious bird, so well known to most people, that I shall only observe, they are here in prodigious numbers, so that we could knock down as many as we pleased with a stick. I cannot say they are good eating. I have indeed made several good meals of them, but it was for want of better victuals. They either do not breed here, or else this was not the season; for we saw neither eggs nor young ones.

Shags breed here in vast numbers; and we carried on board not a few, as they are very good eating. They take certain spots to themselves, and build their nests near the edge of the cliffs on little hillocks, which are either those of the sword-grass, or else they are made by the shags building on them from year to year. There is another sort rather smaller than these, which breed in the cliffs of rocks.

The geese are of the same sort we found in Christmas Sound; we saw but few, and some had young ones. Mr Forster shot one which was different from these, being larger, with a grey plumage, and black feet. The others make a noise exactly like a duck. Here were ducks, but not many; and several of that sort which we called race-horses. We shot some, and found them to weigh twenty-nine or thirty pounds; those who eat of them said they were very good.

The oceanic birds were gulls, terns, Port Egmont hens, and a large brown bird, of the size of an albatross, which Pernety calls quebrantahuessas. We called them Mother Carey's geese, and found them pretty good eating; The land-birds were eagles, or hawks, bald-headed vultures, or what our seamen called turkey-buzzards, thrushes, and a few other small birds.

Our naturalists found two new species of birds. The one is about the size of a pigeon, the plumage as white as milk. They feed along-shore, probably on shell-fish and carrion, for they have a very disagreeable smell. When we first saw these birds we thought they were the snow-peterel, but the moment they were in our possession the mistake was discovered; for they resemble them in nothing but size and colour. These are not web-footed. The other sort is a species of curlews nearly as big as a heron. It has a variegated plumage, the principal colours whereof are light-grey, and a long crooked bill.

I had almost forgot to mention that there are sea-pies, or what we called, when in New Zealand, curlews; but we only saw a few straggling pairs. It may not be amiss to observe, that the shags are the same bird which Bougainville calls saw-bills; but he is mistaken in saying that the quebrantahuessas are their enemies; for this bird is of the peterel tribe, feeds wholly on fish, and is to be found in all the high southern latitudes.

It is amazing to see how the different animals which inhabit this little spot are mutually reconciled. They seem to have entered into a league not to disturb each other's tranquillity. The sea-lions occupy most of the sea-coast; the sea-bears take up their abode in the isle; the shags have post in the highest cliffs; the penguins fix their quarters where there is the most easy communication to and from the sea; and the other birds choose more retired places. We have seen all these animals mix together, like domestic cattle and poultry in a farm-yard, without one attempting to molest the other. Nay, I have often observed the eagles and vultures sitting on the hillocks among the shags, without the latter, either young or old, being disturbed at their presence. It may be asked how these birds of prey live? I suppose on the carcasses of seals and birds which die by various causes; and probably not few, as they are so numerous.

This very imperfect account is written more with a view to assist my own memory than to give information to others. I am neither a botanist nor a naturalist; and have not words to describe the productions of nature, either in the one branch of knowledge or the other.

CHAPTER V.

Proceedings after leaving Staten Island, with an Account of the Discovery of the Isle of Georgia, and a Description of it.

1775 January

Having left the land in the evening of the 3d, as before mentioned, we saw it again next morning, at three o'clock, bearing west. Wind continued to blow a steady fresh breeze till six p.m., when it shifted in a heavy squall to S.W., which came so suddenly upon us, that we had not time to take in the sails, and was the occasion of carrying away a top-gallant mast, a studding-sail boom, and a fore studding-sail. The squall ended in a heavy shower of rain, but the wind remained at S.W. Our course was S.E., with a view of discovering that extensive coast laid down by Mr Dalrymple in his chart, in which is the gulph of St Sebastian. I designed to make the western point of that gulph, in order to have all the other parts before me. Indeed I had some doubt of the existence of such a coast; and this appeared to me the best route for clearing it up, and for exploring the southern part of this ocean.

On the 5th, fresh gales, and wet and cloudy weather. At noon observed in 57deg 9', latitude made from Cape St John, 5deg 2' E. At six o'clock p.m., being in the latitude 57deg 21', and in longitude 57deg 45' W., the variation was 21deg 28' E.

At eight o'clock in the evening of the 6th, being then in the latitude of 58deg 9' S., longitude 53deg 14' W., we close-

reefed our top-sails, and hauled to the north, with a very strong gale at west, attended with a thick haze and sleet. The situation just mentioned is nearly the same that Mr Dalrymple assigns for the S.W. point of the gulph of St Sebastian. But as we saw neither land, nor signs of land, I was the more doubtful of its existence, and was fearful that, by keeping to the south, I might miss the land said to be discovered by La Roche in 1675, and by the ship Lion in 1756, which Mr Dalrymple places in 54deg 30' latitude, and 45deg of longitude; but on looking over D'Anville's chart, I found it laid down 9deg or 10deg more to the west; this difference of situation being to me a sign of the uncertainty of both accounts, determined me to get into the parallel as soon as possible, and was the reason of my hauling to the north at this time.

Towards the morning of the 7th the gale abated, the weather cleared up, and the wind veered to the W.S.W., where it continued till midnight, after which it veered to N.W. Being at this time in the latitude of 56deg 4' S., longitude 53deg 36' W., we sounded, but found no bottom with a line of one hundred and thirty fathoms. I still kept the wind on the larboard-tack, having a gentle breeze and pleasant weather. On the 8th, at noon, a bed of sea-weed passed the ship. In the afternoon, in latitude 55deg 4', longitude 51deg 43' W., the variation was 20deg 4' E.

On the 9th, wind at N.E., attended with thick hazy weather; saw a seal, and a piece of sea-weed. At noon, latitude 55deg 12' S., longitude 50deg 15' W., the wind and weather continuing the same till towards midnight, when the latter cleared up, and the former veered to west, and blew a gentle gale. We continued to ply till two o'clock the next morning, when we bore away east, and at eight E.N.E.; at noon, observed in latitude 54deg 35' S., longitude 47deg 56' W., a great many albatrosses and blue peterels about the ship. I now steered east, and the next morning, in the latitude of 54deg 38', longitude 45deg 10' W., the variation was 19deg 25' E. In the afternoon saw several penguins, and some pieces of weed.

Having spent the night lying-to, on the 12th, at day-break, we bore away, and steered east northerly, with a fine fresh breeze at W.S.W.; at noon observed in latitude 54deg 28' S., longitude in 42deg 8' W.; that is, near 3deg E. of the situation in which Mr Dalrymple places the N.E. point of the gulph of St Sebastian; but we had no other signs of land than seeing a seal and a few penguins; on the contrary, we had a swell from E.S.E., which would hardly have been, if any extensive track of land lay in that direction. In the evening the gale abated, and at midnight it fell calm.

The calm, attended by a thick fog, continued till six next morning, when we got a wind at east, but the fog still prevailed. We stood to the south till noon, when, being in the latitude of 55deg 7', we tacked and stretched to the north with a fresh breeze at E. by S. and E.S.E., cloudy weather; saw several penguins and a snow-peterel, which we looked on to be signs of the vicinity of ice. The air too was much colder than we had felt it since we left New Zealand. In the afternoon the wind veered to the S.E., and in the night to S.S.E., and blew fresh, with which we stood to the N.E.

At nine o'clock the next morning we saw an island of ice, as we then thought, but at noon were doubtful whether it was ice or land. At this time it bore E. $\frac{3}{4}$ S., distant thirteen leagues; our latitude was 53deg 56' $\frac{1}{2}$, longitude 39deg 24' W.; several penguins, small divers, a snow-peterel, and a vast number of blue peterels about the ship. We had but little wind all the morning, and at two p.m. it fell calm. It was now no longer doubted that it was land, and not ice, which we had in sight. It was, however, in a manner wholly covered with snow. We were farther confirmed in our judgement of its being land, by finding soundings at one hundred and seventy-five fathoms, a muddy bottom. The land at this time bore E. by S., about twelve leagues distant. At six o'clock the calm was succeeded by a breeze at N.E., with which we stood to S.E. At first it blew a gentle gale; but afterwards increased so as to bring us under double-reefed top-sails, and was attended with snow and sleet.

We continued to stand to the S.E. till seven in the morning on the 15th, when the wind veering to the S.E., we tacked and stood to the north. A little before we tacked, we saw the land bearing E. by N. At noon the mercury in the thermometer was at 35deg $\frac{1}{4}$. The wind blew in squalls, attended with snow and sleet, and we had a great sea to encounter. At a lee-lurch which the ship took, Mr Wales observed her to lie down 42deg. At half past four p.m. we took in the top-sails, got down top-gallant yards, wore the ship, and stood to the S.W., under two courses. At midnight the storm abated, so that we could carry the top-sails double-reefed.

At four in the morning of the 16th we wore and stood to the east, with the wind at S.S.E., a moderate breeze, and fair; at eight o'clock saw the land extending from E. by N. to N.E. by N.; loosed a reef out of each top-sail, got top-gallant yards across, and set the sails. At noon observed in latitude 54deg 25' $\frac{1}{2}$, longitude 38deg 18' W. In this situation we had one hundred and ten fathoms water; and the land extended from N. $\frac{1}{2}$ W. to E., eight leagues distant. The northern extreme was the same that we first discovered, and it proved to be an island, which obtained the name of Willis's Island, after the person who first saw it.

At this time we had a great swell from the south, an indication that no land was near us in that direction; nevertheless the vast quantity of snow on that in sight induced us to think it was extensive, and I chose to begin with exploring the

northern coast. With this view we bore up for Willis's Island, all sails set, having a fine gale at S.S.W. As we advanced to the north, we perceived another isle lying east of Willis's, and between it and the main. Seeing there was a clear passage between the two isles, we steered for it, and at five o'clock, being in the middle of it, we found it about two miles broad.

Willis's Isle is an high rock of no great extent, near to which are some rocky islets. It is situated in the latitude of 54deg S., longitude 38deg 23' W. The other isle, which obtained the name of Bird Isle, on account of the vast number that were upon it, is not so high, but of greater extent, and is close to the N.E. point of the main land, which I called Cape North.

The S.E. coast of this land, as far as we saw it, lies in the direction of S. 50deg E., and N. 50deg W. It seemed to form several bays or inlets; and we observed huge masses of snow, or ice, in the bottoms of them, especially in one which lies ten miles to the S.S.E. of Bird Isle.

After getting through the passage, we found the north coast trended E. by N., for about nine miles; and then east and east-southerly to Cape Buller, which is eleven miles more. We ranged the coast, at one league distance, till near ten o'clock, when we brought-to for the night, and on sounding found fifty fathoms, a muddy bottom.

At two o'clock in the morning of the 17th we made sail in for the land, with a fine breeze at S.W.; at four, Willis's Isle bore W. by S., distant thirty-two miles; Cape Buller, to the west of which lie some rocky islets, bore S.W. by W.; and the most advanced point of land to the east, S. 63deg E. We now steered along shore, at the distance of four or five miles, till seven o'clock, when, seeing the appearance of an inlet, we hauled in for it. As soon as we drew near the shore, having hoisted out a boat, I embarked in it, accompanied by Mr Forster and his party, with a view of reconnoitring the bay before we ventured in with the ship. When we put off from her, which was about four miles from the shore, we had forty fathoms water. I continued to sound as I went farther in, but found no bottom with a line of thirty-four fathoms, which was the length of that I had in the boat, and which also proved too short to sound the bay, so far as I went up it. I observed it to lie in S.W. by S. about two leagues, about two miles broad, well sheltered from all winds; and I judged there might be good anchorage before some sandy beaches which are on each side, and likewise near a low flat isle, towards the head of the bay. As I had come to a resolution not to bring the ship in, I did not think it worth my while to go and examine these places; for it did not seem probable that any one would ever be benefited by the discovery. I landed at three different places, displayed our colours, and took possession of the country in his majesty's name, under a discharge of small arms.

I judged that the tide rises about four or five feet, and that it is high water on the full and change days about eleven o'clock.

The head of the bay, as well as two places on each side, was terminated by perpendicular ice-cliffs of considerable height. Pieces were continually breaking off, and floating out to sea; and a great fall happened while we were in the bay, which made a noise like cannon.

The inner parts of the country were not less savage and horrible. The wild rocks raised their lofty summits till they were lost in the clouds, and the valleys lay covered with everlasting snow. Not a tree was to be seen, nor a shrub even big enough to make a toothpick. The only vegetation we met with was a coarse strong-bladed grass growing in tufts, wild burnet, and a plant like moss, which sprung from the rocks.

Seals, or sea-bears, were pretty numerous. They were smaller than those at Staten Land: Perhaps the most of those we saw were females, for the shores swarmed with young cubs. We saw none of that sort which we call lions; but there were some of those which the writer of Lord Anson's voyage describes under that name; at least they appeared to us to be of the same sort; and are, in my opinion, very improperly called lions, for I could not see any grounds for the comparison.

Here were several flocks of penguins, the largest I ever saw; some which we brought on board weighed from twenty-nine to thirty-eight pounds. It appears by Bougainville's account of the animals of Falkland Islands, that this penguin is there; and I think it is very well described by him under the name of first class of penguins*. The oceanic birds were albatrosses, common gulls, and that sort which I call Port Egmont hens, terns, shags, divers, the new white bird, and a small bird like those of the Cape of Good Hope, called yellow birds; which, having shot two, we found most delicious food.

[* See Bougainville, English translation p.64.]

All the land birds we saw consisted of a few small larks, nor did we meet with any quadrupeds. Mr Forster indeed observed some dung, which he judged to come from a fox, or some such animal. The lands, or rather rocks, bordering

on the sea-coast, were not covered with snow like the inland parts; but all the vegetation we could see on the clear places was the grass above-mentioned. The rocks seemed to contain iron. Having made the above observations, we set out for the ship, and got on board a little after twelve o'clock, with a quantity of seals and penguins, an acceptable present to the crew.

It must not, however, be understood that we were in want of provisions: we had yet plenty of every kind; and since we had been on this coast, I had ordered, in addition to the common allowance, wheat to be boiled every morning for breakfast; but any kind of fresh meat was preferred by most on board to salt. For my own part, I was now, for the first time, heartily tired of salt meat of every kind; and though the flesh of the penguins could scarcely vie with bullock's liver, its being fresh was sufficient to make it go down. I called the bay we had been in, Possession Bay. It is situated in the latitude of 54deg 5' S., longitude 37deg 18' W., and eleven leagues to the east of Cape North. A few miles to the west of Possession Bay, between it and Cape Buller, lies the Bay of Isles, so named on account of several small isles lying in and before it.

As soon as the boat was hoisted in, we made sail along the coast to the east, with a fine breeze at W.S.W. From Cape Buller the direction of the coast is S. 72deg 30' E., for the space of eleven or twelve leagues, to a projecting point, which obtained the name of Cape Saunders. Beyond this cape is a pretty large bay, which I named Cumberland Bay. In several parts in the bottom of it, as also in some others of less extent, lying between Cape Saunders and Possession Bay, were vast tracks of frozen snow, or ice, not yet broken loose. At eight o'clock, being just past Cumberland Bay, and falling little wind, we hauled off the coast, from which we were distant about four miles, and found one hundred and ten fathoms water.

We had variable light airs and calms till six o'clock the next morning, when the wind fixed at north, and blew a gentle breeze; but it lasted no longer than ten o'clock, when it fell almost to a calm. At noon, observed in latitude 54deg 30' S., being then about two or three leagues from the coast, which extended from N. 59deg W. to S. 13deg W. The land in this last direction was an isle, which seemed to be the extremity of the coast to the east. The nearest land to us being a projecting point which terminated in a round hillock, was, on account of the day, named Cape Charlotte. On the west side of Cape Charlotte lies a bay which obtained the name of Royal Bay, and the west point of it was named Cape George. It is the east point of Cumberland Bay, and lies in the direction of S.E. by E. from Cape Saunders, distant seven leagues. Cape George and Cape Charlotte lie in the direction of S. 37deg E. and N. 37deg W., distant six leagues from each other. The isle above-mentioned, which was called Cooper's Isle, after my first lieutenant, lies in the direction of S. by E., distant eight leagues from Cape Charlotte. The coast between them forms a large bay, to which I gave the name of Sandwich. The wind being variable all the afternoon we advanced but little; in the night it fixed at S. and S.S.W., and blew a gentle gale, attended with showers of snow.

The 19th was wholly spent in plying, the wind continuing at S. and S.S.W., clear pleasant weather, but cold. At sunrise a new land was seen, bearing S.E. 1/2 E. It first appeared in a single hill, like a sugar-loaf; some time after other detached pieces appeared above the horizon near the hill. At noon, observed in the latitude 54deg 42' 30" S., Cape Charlotte bearing N. 38deg W., distant four leagues; and Cooper's Isle S. 31deg W. In this situation a lurking rock, which lies off Sandwich Bay, five miles from the land, bore W. 1/2 N., distant one mile, and near this rock were several breakers. In the afternoon we had a prospect of a ridge of mountains behind Sandwich Bay, whose lofty and icy summits were elevated high above the clouds. The wind continued at S.S.W. till six o'clock, when it fell to a calm. At this time Cape Charlotte bore N. 31deg W., and Cooper's Island W.S.W. In this situation we found the variation, by the azimuths, to be 11deg 39', and by the amplitude, 11deg 12' E. At ten o'clock, a light breeze springing up at north, we steered to the south till twelve, and then brought-to for the night.

At two o'clock in the morning of the 20th we made sail to S.W. round Cooper's Island. It is a rock of considerable height, about five miles in circuit, and one mile from the main. At this isle the main coast takes a S.W. direction for the space of four or five leagues to a point, which I called Cape Disappointment. Off that are three small isles, the southernmost of which is green, low, and flat, and lies one league from the cape.

As we advanced to S.W. land opened, off this point, in the direction of N. 60deg W., and nine leagues beyond it. It proved an island quite detached from the main, and obtained the name of Pickersgill Island, after my third officer. Soon after a point of the main, beyond this island, came in sight, in the direction of N. 55deg W., which exactly united the coast at the very point we had seen, and taken the bearing of, the day we first came in with it, and proved to a demonstration that this land, which we had taken for part of a great continent, was no more than an island of seventy leagues in circuit.

Who would have thought that an island of no greater extent than this, situated between the latitude of 54deg and 55deg, should, in the very height of summer, be in a manner wholly covered, many fathoms deep, with frozen snow, but

more especially the S.W. coast? The very sides and craggy summits of the lofty mountains were cased with snow and ice; but the quantity which lay in the valleys is incredible; and at the bottom of the bays the coast was terminated by a wall of ice of considerable height. It can hardly be doubted that a great deal of ice is formed here in the water, which in the spring is broken off, and dispersed over the sea; but this island cannot produce the ten-thousandth part of what we saw; so that either there must be more land, or the ice is formed without it. These reflections led me to think that the land we had seen the preceding day might belong to an extensive track, and I still had hopes of discovering a continent. I must confess the disappointment I now met with did not affect me much; for, to judge of the bulk by the sample, it would not be worth the discovery.

I called this island the isle of Georgia, in honour of his majesty. It is situated, between the latitudes of 53deg 57' and 54deg 57' S.; and between 38deg 13' and 35deg 34' west longitude. It extends S.E. by E. and N.W. by W., and is thirty-one leagues long in that direction; and its greatest breadth is about ten leagues. It seems to abound with bays and harbours, the N.E. coast especially; but the vast quantity of ice must render them inaccessible the greatest part of the year; or, at least, it must be dangerous lying in them, on account of the breaking up of the ice cliffs.

It is remarkable that we did not see a river, or stream of fresh water, on the whole coast. I think it highly probable that there are no perennial springs in the country; and that the interior parts, as being much elevated, never enjoy heat enough to melt the snow in such quantities as to produce a river, or stream, of water. The coast alone receives warmth sufficient to melt the snow, and this only on the N.E. side; for the other, besides being exposed to the cold south winds, is, in a great degree, deprived of the sun's rays, by the uncommon height of the mountains.

It was from a persuasion that the sea-coast of a land situated in the latitude of 54deg, could not, in the very height of summer, be wholly covered with snow, that I supposed Bouvet's discovery to be large islands of ice. But after I had seen this land, I no longer hesitated about the existence of Cape Circumcision; nor did I doubt that I should find more land than I should have time to explore. With these ideas I quitted this coast, and directed my course to the E.S.E. for the land we had seen the preceding day.

The wind was very variable till noon, when it fixed at N.N.E., and blew a gentle gale; but it increased in such a manner, that, before three o'clock, we were reduced to our two courses, and obliged to strike top-gallant yards. We were very fortunate in getting clear of the land, before this gale overtook us; it being hard to say what might have been the consequence had it come on while we were on the north coast. This storm was of short duration; for, at eight o'clock it began to abate; and at midnight it was little wind. We then took the opportunity to sound, but found no bottom with a line of an hundred and eighty fathoms.

Next day the storm was succeeded by a thick fog, attended with rain; the wind veered to N.W., and, at five in the morning, it fell calm, which continued till eight; and then we got a breeze southerly, with which we stood to the east till three in the afternoon. The weather then coming somewhat clear, we made sail, and steered north in search of land; but, at half-past six, we were again involved in a thick mist, which made it necessary to haul the wind, and spend the night in making short boards.

We had variable light airs next to a calm, and thick foggy weather, till half-past seven o'clock in the evening of the 22d, when we got a fine breeze at north, and the weather was so clear that we could see two or three leagues round us. We seized the opportunity, and steered to west; judging we were to the east of the land. After running ten miles to the west, the weather again became foggy, and we hauled the wind, and spent the night under top-sails.

Next morning at six o'clock, the fog clearing away, so that we could see three or four miles, I took the opportunity to steer again to the west, with the wind at east, a fresh breeze; but two hours after, a thick fog once more obliged us to haul the wind to the south. At eleven o'clock, a short interval of clear weather gave us view of three or four rocky islets extending from S.E. to E.N.E., two or three miles distant; but we did not see the Sugar-Loaf Peak beforementioned. Indeed, two or three miles was the extent of our horizon.

We were well assured that this was the land we had seen before, which we had now been quite round; and therefore it could be no more than a few detached rocks, receptacles for birds, of which we now saw vast numbers, especially shags, who gave us notice of the vicinity of land before we saw it. These rocks lie in the latitude of 55deg S., and S. 75deg E., distant twelve leagues from Cooper's Isle.

The interval of clear weather was of very short duration, before we had as thick a fog as ever, attended with rain, on which we tacked in sixty fathoms water, and stood to the north. Thus we spent our time, involved in a continual thick mist; and, for aught we knew, surrounded by dangerous rocks. The shags and soundings were our best pilots; for after we had stood a few miles to the north, we got out of soundings, and saw no more shags. The succeeding day and

night we spent in making short boards; and at eight o'clock on the 24th, judging ourselves not far from the rocks by some straggling shags which came about us, we sounded in sixty fathoms water, the bottom stones and broken shells. Soon after, we saw the rocks bearing S.S.W. 1/2 W., four miles distant, but still we did not see the peak. It was, no doubt, beyond our horizon, which was limited to a short distance; and, indeed, we had but a transient sight of the other rocks, before they were again lost in the fog.

With a light air of wind at north, and a great swell from N.E., we were able to clear the rocks to the west; and, at four in the p.m., judging ourselves to be three or four leagues east and west of them, I steered south, being quite tired with cruising about them in a thick fog; nor was it worth my while to spend any more time in waiting for clear weather, only for the sake of having a good sight of a few straggling rocks. At seven o'clock, we had at intervals a clear sky to the west, which gave us a sight of the mountains of the isle of Georgia, bearing W.N.W., about eight leagues distant. At eight o'clock we steered S.E. by S., and at ten S.E. by E., with a fresh breeze at north, attended with a very thick fog; but we were, in some measure, acquainted with the sea over which we were running. The rocks above-mentioned obtained the name of Clerke's Rocks, after my second officer, he being the first who saw them.

CHAPTER VI.

Proceedings after leaving the Isle of Georgia, with an Account of the Discovery of Sandwich Land; with some Reasons for there being Land about the South Pole.

1775 January

On the 25th, we steered E.S.E., with a fresh gale at N.N.E., attended with foggy weather, till towards the evening, when the sky becoming clear, we found the variation to be 9deg 26' E., being at this time in the latitude of 56deg 16' S., longitude 32deg 9' W.

Having continued to steer E.S.E., with a fine gale at N.N.W., till day-light next morning, on seeing no land to the east, I gave orders to steer south, being at this time in the latitude of 56deg 33' S., longitude 31deg 10' W. The weather continued clear, and gave us an opportunity to observe several distances of the sun and moon for the correcting our longitude, which at noon was 31deg 4' W., the latitude observed 57deg 38' S. We continued to steer to the south till the 27th, at noon, at which time we were in the latitude of 59deg 46' S., and had so thick a fog that we could not see a ship's length. It being no longer safe to sail before the wind, as we were to expect soon to fall in with ice, I therefore hauled to the east, having a gentle breeze at N.N.E. Soon after the fog clearing away, we resumed our course to the south till four o'clock, when it returned again as thick as ever, and made it necessary for us to haul upon a wind.

I now reckoned we were in latitude 60deg S., and farther I did not intend to go, unless I observed some certain signs of soon meeting with land. For it would not have been prudent in me to have spent my time in penetrating to the south, when it was at least as probable that a large tract of land might be found near Cape Circumcision. Besides, I was tired of these high southern latitudes, where nothing was to be found but ice and thick fogs. We had now a long hollow swell from the west, a strong indication that there was no land in that direction; so that I think I may venture to assert that the extensive coast, laid down in Mr Dalrymple's chart of the ocean between Africa and America, and the Gulph of St Sebastian, do not exist.

At seven o'clock in the evening, the fog receding from us a little, gave us a sight of an ice island, several penguins and some snow peterels; we sounded, but found no ground at one hundred and forty fathoms. The fog soon returning, we spent the night in making boards over that space which we had, in some degree, made ourselves acquainted with in the day.

At eight in the morning of the 28th, we stood to the east, with a gentle gale at north; the weather began to clear up; and we found the sea strewed with large and small ice; several penguins, snow peterels, and other birds were seen, and some whales. Soon after we had sun-shine, but the air was cold; the mercury in the thermometer stood generally at thirty-five, but at noon it was 37deg; the latitude by observation was 60deg 4' S., longitude 29deg 23' W.

We continued to stand to the east till half-past two o'clock, p.m., when we fell in, all at once, with a vast number of large ice-islands, and a sea strewed with loose ice. The weather too was become thick and hazy, attended with drizzling rain and sleet, which made it the more dangerous to stand in among the ice. For this reason we tacked and stood back to the west, with the wind at north. The ice-islands, which at this time surrounded us, were nearly all of equal height, and shewed a flat even surface; but they were of various extent, some being two or three miles in circuit. The loose ice was what had broken from these isles.

Next morning, the wind falling and veering to S.W., we steered N.E.; but this course was soon intercepted by numerous

ice-islands; and, having but very little wind, we were obliged to steer such courses as carried us the clearest of them; so that we hardly made any advance, one way or other, during the whole day. Abundance of whales and penguins were about us all the time; and the weather fair, but dark and gloomy.

At midnight the wind began to freshen at N.N.E., with which we stood to the N.W., till six in the morning of the 30th, when the wind veering to N.N.W., we tacked and stood to N.E., and soon after sailed through a good deal of loose ice, and passed two large islands. Except a short interval of clear weather about nine o'clock, it was continually foggy, with either sleet or snow. At noon we were, by our reckoning, in the latitude of 59deg 30' S., longitude 29deg 24' W.

Continuing to stand to N.E. with a fresh breeze at N.N.W., at two o'clock, we passed one of the largest ice-islands we had seen in the voyage, and some time after passed two others, which were much smaller; Weather still foggy, with sleet: And the wind continued at N. by W., with which we stood to N.E., over a sea strewn with ice.

At half an hour past six next morning, as we were standing N.N.E. with the wind at west, the fog very fortunately clearing away a little, we discovered land ahead, three or four miles distant. On this we hauled the wind to the north; but finding we could not weather the land on this tack, we soon after tacked in one hundred and seventy-five fathoms water, three miles from the shore, and about half a league from some breakers. The weather then cleared up a little more, and gave us a tolerably good sight of the land. That which we had fallen in with proved three rocky islets of considerable height. The outermost terminated in a lofty peak like a sugar-loaf, and obtained the name of Freezeland Peak, after the man who first discovered it. Latitude 59deg S., longitude 27deg W. Behind this peak, that is to the east of it, appeared an elevated coast, whose lofty snow-clad summits were seen above the clouds. It extended from N. by E. to E.S.E., and I called it Cape Bristol, in honour of the noble family of Hervey. At the same time another elevated coast appeared in sight, bearing S.W. by S., and at noon it extended from S.E. to S.S.W., from four to eight leagues distant; at this time the observed latitude was 59deg 13' 30" S., longitude 27deg 45' W. I called this land Southern Thule, because it is the most southern land that has ever yet been discovered. It shews a surface of vast height, and is every where covered with snow. Some thought they saw land in the space between Thule and Cape Bristol. It is more than probable that these two lands are connected, and that this space is a deep bay, which I called Forster's Bay.

At one o'clock, finding that we could not weather Thule, we tacked and stood to the north, and at four, Freezeland Peak bore east, distant three or four leagues. Soon after, it fell little wind, and we were left to the mercy of a great westerly swell, which set right upon the shore. We sounded, but a line of two hundred fathoms found no bottom.

At eight o'clock, the weather, which had been very hazy, clearing up, we saw Cape Bristol bearing E.S.E., and terminating in a point to the north, beyond which we could see no land. This discovery relieved us from the fear of being carried by the swell on the most horrible coast in the world, and we continued to stand to the north all night, with a light breeze at west.

1775 February

On the 1st of February, at four o'clock in the morning, we got sight of a new coast, which at six o'clock bore N. 60deg east. It proved a high promontory, which I named Cape Montagu, situated in latitude 58deg 27' S., longitude 26deg 44' west, and seven or eight leagues to the north of Cape Bristol. We saw land from space to space between them, which made me conclude that the whole was connected. I was sorry I could not determine this with greater certainty; but prudence would not permit me to venture near a coast, subject to thick fogs, on which there was no anchorage; where every port was blocked or filled up with ice; and the whole country, from the summits of the mountains, down to the very brink of the cliffs which terminate the coast, covered, many fathoms thick, with everlasting snow. The cliffs alone was all which was to be seen like land.

Several large ice-islands lay upon the coast; one of which attracted my notice. It had a flat surface, was of considerable extent both in height and circuit, and had perpendicular sides, on which the waves of the sea had made no impression; by which I judged that it had not been long from land, and that it might lately have come out of some bay on the coast, where it had been formed.

At noon we were east and west of the northern part of Cape Montagu, distant about five leagues, and Freezeland Peak bore S. 16deg east, distant twelve leagues; latitude observed 58deg 25' S. In the morning the variation was 10deg 11' east. At two in the afternoon, as we were standing to the north, with a light breeze at S.W., we saw land bearing N. 25' east, distant fourteen leagues. Cape Montagu bore at this time, S. 66deg east; at eight it bore S. 40deg east; Cape Bristol, S. by E.; the new land extending from N. 40deg to 52deg east; and we thought we saw land still more to the east, and beyond it.

Continuing to steer to the north all night, at six o'clock the next morning a new land was seen bearing N. 12deg east,

about ten leagues distant. It appeared in two hummocks just peeping above the horizon; but we soon after lost sight of them; and having got the wind at N.N.E. a fresh breeze, we stood for the northernmost land we had seen the day before, which at this time bore E.S.E. We fetched in with it by ten o'clock, but could not weather it, and were obliged to tack three miles from the coast, which extended from E. by S. to S.E., and had much the appearance of being an island of about eight or ten leagues circuit. It shews a surface of considerable height, whose summit was lost in the clouds, and, like all the neighbouring lands, covered with a sheet of snow and ice, except in a projecting point on the north side, and two hills seen over this point, which probably might be two islands. These only were clear of snow, and seemed covered with a green turf. Some large ice islands lay to the N.E., and some others to the south.

We stood off till noon, and then tacked for the land again, in order to see whether it was an island or no. The weather was now become very hazy, which soon turning to a thick fog, put a stop to discovery, and made it unsafe to stand for the shore; so that after having run the same distance in, as we had run off, we tacked and stood to N.W., for the land we had seen in the morning, which was yet at a considerable distance. Thus we were obliged to leave the other, under the supposition of its being an island, which I named Saunders, after my honourable friend Sir Charles. It is situated in the latitude of 57deg 49' south longitude, 26deg 44' west; and north, distant thirteen leagues, from Cape Montagu.

At six o'clock in the evening, the wind shifting to the west, we tacked, and stood to the north; and at eight the fog clearing away, gave us a sight of Saunders's Isle, extending from S.E. by S. to E.S.E. We were still in doubt if it was an island; for, at this time, land was seen bearing E. by S., which might or might not be connected with it; it might also be the same that we had seen the preceding evening. But, be this as it may, it was now necessary to take a view of the land to the north, before we proceeded any farther to the east. With this intention, we stood to the north, having a light breeze at W. by S., which at two o'clock in the morning of the 3d, was succeeded by a calm that continued till eight, when we got the wind at E. by S. attended by hazy weather. At this time we saw the land we were looking for, and which proved to be two isles. The day on which they were discovered, was the occasion of calling them Candlemas Isles; latitude 57deg 11' S., longitude 27deg 6' W. They were of no great extent, but of considerable height, and were covered with snow. A small rock was seen between them, and perhaps there may be more; for the weather was so hazy that we soon lost sight of the islands, and did not see them again till noon, at which time they bore west, distant three or four leagues.

As the wind kept veering to the south, we were obliged to stand to the N.E., in which route we met with several large ice islands, loose ice, and many penguins; and at midnight, came at once into water uncommonly white, which alarmed the officer of the watch so much, that he tacked the ship instantly. Some thought it was a float of ice; others that it was shallow water; but, as it proved neither, probably it was a shoal of fish.

We stood to the south till two o'clock next morning, when we resumed our course to the east with a faint breeze at S.S.E. which having ended in a calm, at six, I took the opportunity of putting a boat in the water to try if there were any current; and the trial proved there was none. Some whales were playing about us, and abundance of penguins: a few of the latter were shot, and they proved to be of the same sort that we had seen among the ice before, and different both from those on Staten Land, and from those at the isle of Georgia. It is remarkable, that we had not seen a seal since we left that coast. At noon we were in latitude of 56deg 44' S., longitude 25deg 33' W. At this time we got a breeze at east, with which we stood to the south, with a view of gaining the coast we had left; but at eight o'clock the wind shifted to the south, and made it necessary to tack and stand to the east; in which course we met with several ice-islands and some loose ice; the weather continuing hazy with snow and rain.

No penguins were seen on the 5th, which made me conjecture that we were leaving the land behind us, and that we had already seen its northern extremity. At noon we were in the latitude of 57deg 8' S., longitude 23deg 34' west, which was 3deg of longitude to the east of Saunders's Isle. In the afternoon the wind shifted to the west; this enabled us to stretch to the south, and to get into the latitude of the land, that, if it took an east direction, we might again fall in with it.

We continued to steer to the south and S.E. till next day at noon, at which time we were in the latitude of 58deg 15' S., longitude 21deg 34' west, and seeing neither land nor signs of any, I concluded that what we had seen, which I named Sandwich Land, was either a group of islands, or else a point of the continent. For I firmly believe that there is a tract of land near the Pole which is the source of most of the ice that is spread over this vast southern ocean. I also think it probable that it extends farthest to the north opposite the southern Atlantic and Indian oceans; because ice was always found by us farther to the north in these oceans than any where else, which I judge could not be, if there were not land to the south; I mean a land of considerable extent. For if we suppose that no such land exists, and that ice may be formed without it, it will follow of course that the cold ought to be every where nearly equal round the Pole, as far as 70deg or 60' of latitude, or so far as to be beyond the influence of any of the known continents; consequently we ought to see ice every where under the same parallel, or near it; and yet the contrary has been, found. Very few ships have met

with ice going round Cape Horn: And we saw but little below the sixtieth degree of latitude, in the Southern Pacific Ocean. Whereas in this ocean, between the meridian of 40deg west and 50deg or 60deg east, we found ice as far north as 51deg. Bouvet met with, some in 48deg, and others have seen it in a much lower latitude. It is true, however, that the greatest part of this southern continent (supposing there is one), must lie within the polar circle, where the sea is so pestered with ice, that the land is thereby inaccessible. The risque one runs in exploring a coast, in these unknown and icy seas, is so very great, that I can be bold enough to say that no man will ever venture farther than I have done; and that the lands which may lie to the south will never be explored. Thick fogs, snow storms, intense cold, and every other thing that can render navigation dangerous, must be encountered, and these difficulties are greatly heightened by the inexpressibly horrid aspect of the country; a country doomed by nature never once to feel the warmth of the sun's rays, but to lie buried in everlasting snow and ice. The ports which may be on the coast, are, in a manner, wholly filled up with frozen snow of vast thickness; but if any should be so far open as to invite a ship into it, she would run a risque of being fixed there for ever, or of coming out in an ice island. The islands and floats on the coast, the great falls from the ice-cliffs in the port, or a heavy snow-storm attended with a sharp frost, would be equally fatal.

After such an explanation as this, the reader must not expect to find me much farther to the south. It was, however, not for want of inclination, but for other reasons. It would have been rashness in me to have risked all that had been done during the voyage, in discovering and exploring a coast, which, when discovered and explored, would have answered no end whatever, or have been of the least use, either to navigation or geography, or indeed to any other science. Bouvet's discovery was yet before us, the existence of which was to be cleared up; and, besides all this, we were not now in a condition to undertake great things; nor indeed was there time, had we been ever so well provided.

These reasons induced me to alter the course to the east, with a very strong gale at north, attended with an exceedingly heavy fall of snow. The quantity which lodged on our sails was so great, that we were frequently obliged to throw the ship up in the wind to shake it out of them, otherwise neither they nor the ship could have supported the weight. In the evening it ceased to snow; the weather cleared up, the wind backed to the west, and we spent the night in making two short boards, under close-reefed top-sails and fore-sail.

At day-break on the 7th, we resumed our course to the east, with a very fresh gale at S.W. by W., attended by a high sea from the same direction. In the afternoon, being in the latitude of 58deg 24' S., longitude 16deg 19' west, the variation was 1deg 52' east. Only three ice-islands seen this day. At eight o'clock, shortened sail, and hauled the wind to the S.E. for the night, in which we had several showers of snow and sleet.

On the 8th at day-light, we resumed our east course with a gentle breeze and fair weather. After sun-rise, being then in the latitude of 58deg 30' S., longitude 15deg 14' west, the variation, by the mean results of two compasses, was 2deg 43' east. These observations were more to be depended on than those made the night before, there being much less sea now than then. In the afternoon, we passed three ice-islands. This night was spent as the preceding.

At six next morning, being in the latitude of 58deg 27' S., longitude 13deg 4' W., the variation was 26' E.; and in the afternoon, being in the same latitude, and about a quarter of a degree more to the east, it was 2' west. Therefore this last situation must be in or near the Line, in which the compass has no variation. We had a calm the most part of the day. The weather fair and clear, excepting now and then a snow-shower. The mercury in the thermometer at noon rose to 40; whereas, for several days before, it had been no higher than 36 or 38. We had several ice-islands in sight, but no one thing that could induce us to think that any land was in our neighbourhood. At eight in the evening a breeze sprung up at S.E., with which we stood to N.E.

During the night the wind freshened and veered south, which enabled us to steer east. The wind was attended with showers of sleet and snow till day-light, when the weather became fair, but piercing cold, so that the water on deck was frozen, and at noon the mercury in the thermometer was no higher than 34-1/2. At six o'clock in the morning, the variation was 23' west, being then in the latitude of 58deg 15' S., longitude 11deg 41' W; and at six in the evening, being in the same latitude, and in the longitude of 9deg 24' W., it was 1deg 51' W. In the evening the wind abated; and during the night, it was variable between south and west. Ice-islands continually in sight.

On the 11th, wind westerly, light airs attended with heavy showers of snow in the morning; but as the day advanced, the weather became fair, clear, and serene. Still continuing to steer east, at noon we observed in latitude 58deg 11', longitude at the same time 7deg 55' west. Thermometer 34-2/3. In the afternoon we had two hours calm; after which we had faint breezes between the N.E. and S.E.

At six o'clock in the morning of the 12th, being in the latitude of 58deg 23' S., longitude 6deg 54' W., the variation was 3deg 23' west. We had variable light airs next to a calm all this day, and the weather was fair and clear till towards the evening, when it became cloudy with snow-showers, and the air very cold. Ice-islands continually in sight; most of

them small and breaking to pieces.

In the afternoon of the 13th, the wind increased, the sky became clouded, and soon after we had a very heavy fall of snow, which continued till eight or nine o'clock in the evening, when the wind abating and veering to S.E., the sky cleared up, and we had a fair night, attended with so sharp a frost, that the water in all our vessels on deck was next morning covered with a sheet of ice. The mercury in the thermometer was as low as 29deg, which is 3deg below freezing, or rather 4; for we generally found the water freeze when the mercury stood at 33deg.

Towards noon on the 14th, the wind veering to the south, increased to a very strong gale, and blew in heavy squalls attended with snow. At intervals, between the squalls, the weather was fair and clear, but exceedingly cold. We continued to steer east, inclining a little to the north, and in the afternoon crossed the first meridian, or that of Greenwich, in the latitude of 57deg 50' S. At eight in the evening, we close-reefed the top-sails, took in the main-sail, and steered east with a very hard gale at S.S.W., and a high sea from the same direction.

At day-break on the 15th, we set the main-sail, loosed a reef out of each top-sail, and with a very strong gale at S.W., and fair weather, steered E.N.E. till noon, at which time we were in latitude of 50deg 37' S., longitude 4deg 11' E., when we pointed to the N.E., in order to get into the latitude of Cape Circumcision. Some large ice-islands were in sight, and the air was nearly as cold as on the preceding day. At eight o'clock in the evening, shortened sail, and at eleven hauled the wind to the N.W., not daring to stand on in the night, which was foggy, with snow-showers, and a smart frost.

At day-break on the 16th, we bore away N.E., with a light breeze at west, which, at noon, was succeeded by a calm and fair weather. Our latitude at this time was 55deg 26' S., longitude 5deg 52' E., in which situation we had a great swell from the southward, but no ice in sight. At one o'clock in the p.m., a breeze springing up at E.N.E., we stood to S.E. till six, then tacked, and stood to the north, under double-reefed top-sails and courses, having a very fresh gale attended with snow and sleet, which fixed to the masts and rigging as it fell, and coated the whole with ice.

On the 17th the wind continued veering, by little and little, to the south, till midnight, when it fixed at S.W. Being at this time in the latitude of 54deg 20' S., longitude 6deg 33' east, I steered east, having a prodigious high sea from the south, which assured us no land was near in that direction.

In the morning of the 18th, it ceased to snow; the weather became fair and clear; and we found the variation to be 18deg 44' west. At noon we were in the latitude of 54deg 25', longitude 8deg 46' east. I thought this a good latitude to keep in, to look for Cape Circumcision; because, if the land had ever so little extent in the direction of north and south, we could not miss seeing it, as the northern point is said to lie in 54deg. We had yet a great swell from the south, so that I was now well assured it could only be an island, and it was of no consequence which side we fell in with. In the evening Mr Wales made several observations of the moon, and stars Regulus and Spica; the mean results, at four o'clock when the observations were made, for finding the time by the watch, gave 9deg 15' 20" east longitude. The watch at the same time gave 9deg 36' 45". Soon after the variation was found to be 13deg 10' west. It is nearly in this situation that Mr Bouvet had 1deg east. I cannot suppose that the variation has altered so much since that time; but rather think he had made some mistake in his observations. That there could be none in ours was certain, from the uniformity for some time past. Besides, we found 12deg 8' west, variation, nearly under this meridian, in January 1773. During the night the wind veered round by the N.W. to N.N.E. and blew a fresh gale.

At eight in the morning of the 19th, we saw the appearance of land in the direction of E. by S., or that of our course; but it proved a mere fog-bank, and soon after dispersed. We continued to steer E. by S. and S.E., till seven o'clock in the evening, when being in the latitude of 54deg 42' S., longitude 13deg 3' E., and the wind having veered to N.E., we tacked and stood to N.W. under close-reefed topsails and courses; having a very strong gale attended with snow-showers.

At four o'clock next morning, being in the latitude of 54deg 30' S., longitude 12deg 33' east, we tacked and stretched to N.E. with a fresh gale at S.W., attended with snow-showers and sleet. At noon, being in the latitude of 54deg 8' S., longitude 12deg 59' E., with a fresh gale at W. by N., and tolerably clear weather, we steered east till ten o'clock in the evening, when we brought-to, lest we might pass any land in the night, of which we however had not the least signs.

At day-break, having made sail, we bore away E., and at noon observed in latitude 54deg 16' S., longitude 16deg 13' east, which is 5deg to the east of the longitude in which Cape Circumcision is said to lie; so that we began to think there was no such land in existence. I however continued to steer east, inclining a little to the south, till four o'clock in the afternoon of the next day, when we were in latitude 54deg 24' S., longitude 19deg 18' east.

We had now run down thirteen degrees of longitude in the very latitude assigned for Bouvet's Land. I was therefore well assured that what he had seen could be nothing but an island of ice; for, if it had been land, it is hardly possible we could have missed it, though it were ever so small. Besides, from the time of leaving the southern lands, we had not met

with the least signs of any other. But even suppose we had, it would have been no proof of the existence of Cape Circumcision; for I am well assured that neither seals nor penguins, nor any of the oceanic birds, are indubitable signs of the vicinity of land. I will allow that they are found on the coasts of all these southern lands; but are they not also to be found in all parts of the southern ocean? There are, however, some oceanic or aquatic birds which point out the vicinity of land; especially shags, which seldom go out of sight of it; and gannets, boobies, and men-of-war birds, I believe, seldom go very far out to sea.

As we were now no more than two degrees of longitude front our route to the south, when we left the Cape of Good Hope, it was to no purpose to proceed any farther to the east under this parallel, knowing that no land could be there. But an opportunity now offering of clearing up some doubts of our having seen land farther to the south, I steered S.E. to get into the situation in which it was supposed to lie.

We continued this course till four o'clock the next morning, and then S.E. by E. and E.S.E., till eight in the evening, at which time we were in the latitude of 55deg 25' S., longitude 23deg 22' east, both deduced from observations made the same day; for, in the morning, the sky was clear at intervals, and afforded an opportunity to observe several distances of the sun and moon, which we had not been able to do for some time past, having had a constant succession of bad weather.

Having now run over the place where the land was supposed to lie, without seeing the least signs of any, it was no longer to be doubted but that the ice-islands had deceived us as well as Mr Bouvet. The wind by this time having veered to the north, and increased to a perfect storm, attended as usual with snow and sleet, we handed the top-sails and hauled up E.N.E. under the courses. During the night the wind abated, and veered to N.W., which enabled us to steer more to the north, having no business farther south.

CHAPTER VII.

Heads of what has been done in the Voyage; with some Conjectures concerning the Formation of Ice-Islands; and an Account of our Proceedings till our Arrival at the Cape of Good Hope.

1775 February

I had now made the circuit of the southern ocean in a high latitude, and traversed it in such a manner as to leave not the least room for the possibility of there being a continent, unless near the Pole, and out of the reach of navigation. By twice visiting the tropical sea, I had not only settled the situation of some old discoveries, but made there many new ones, and left, I conceive, very little more to be done even in that part. Thus I flatter myself, that the intention of the voyage has, in every respect, been fully answered; the southern hemisphere sufficiently explored, and a final end put to the searching after a southern continent, which has, at times, ingrossed the attention of some of the maritime powers, for near two centuries past, and been a favourite theory amongst the geographers of all ages.

That there may be a continent, or large tract of land, near the Pole, I will not deny; on the contrary I am of opinion there is; and it is probable that we have seen a part of it. The excessive cold, the many islands and vast floats of ice, all tend to prove that there must be land to the south; and for my persuasion that this southern land must lie, or extend, farthest to the north opposite to the southern Atlantic and Indian oceans, I have already assigned some reasons; to which I may add the greater degree of cold experienced by us in these seas, than in the southern Pacific ocean under the same parallels of latitude.

In this last ocean, the mercury in the thermometer seldom fell so low as the freezing point, till we were in 60deg and upwards; whereas in the others, it fell as low in the latitude of 54deg. This was certainly owing to there being a greater quantity of ice, and to its extending farther to the north, in these two seas than in the south Pacific; and if ice be first formed at, or near land, of which I have no doubt, it will follow that the land also extends farther north.

The formation or coagulation of ice-islands has not, to my knowledge, been thoroughly investigated. Some have supposed them to be formed by the freezing of the water at the mouths of large rivers, or great cataracts, where they accumulate till they are broken off by their own weight. My observations will not allow me to acquiesce in this opinion; because we never found any of the ice which we took up incorporated with earth, or any of its produce, as I think it must have been, had it been coagulated in land-waters. It is a doubt with me, whether there be any rivers in these countries. It is certain, that we saw not a river, or stream of water, on all the coast of Georgia, nor on any of the southern lands. Nor did we ever see a stream of water run from any of the ice-islands. How are we then to suppose that there are large rivers? The valleys are covered, many fathoms deep, with everlasting snow; and, at the sea, they terminate in icy cliffs of vast height. It is here where the ice-islands are formed; not from streams of water, but from consolidated snow

and sleet, which is almost continually falling or drifting down from the mountains, especially in the winter, when the frost must be intense. During that season, the ice-cliffs must so accumulate as to fill up all the bays, be they ever so large. This is a fact which cannot be doubted, as we have seen it so in summer. These cliffs accumulate by continual falls of snow, and what drifts from the mountains, till they are no longer able to support their own weight; and then large pieces break off, which we call ice-islands. Such as have a flat even surface, must be of the ice formed in the bays, and before the flat vallies; the others, which have a tapering unequal surface, must be formed on, or under, the side of a coast composed of pointed rocks and precipices, or some such uneven surface. For we cannot suppose that snow alone, as it falls, can form, on a plain surface, such as the sea, such a variety of high peaks and hills, as we saw on many of the ice-isles. It is certainly more reasonable to believe that they are formed on a coast whose surface is something similar to theirs. I have observed that all the ice-islands of any extent, and before they begin to break to pieces, are terminated by perpendicular cliffs of clear ice or frozen snow, always on one or more sides, but most generally all round. Many, and those of the largest size, which had a hilly and spiral surface, shewed a perpendicular cliff, or side, from the summit of the highest peak down to its base. This to me was a convincing proof, that these, as well as the flat isles, must have broken off from substances like themselves, that is, from some large tract of ice.

When I consider the vast quantity of ice we saw, and the vicinity of the places to the Pole where it is formed, and where the degrees of longitude are very small, I am led to believe that these ice-cliffs extend a good way into the sea, in some parts, especially in such as are sheltered from the violence of the winds. It may even be doubted if ever the wind is violent in the very high latitudes. And that the sea will freeze over, or the snow that falls upon it, which amounts to the same thing, we have instances in the northern hemisphere. The Baltic, the Gulph of St Laurence, the Straits of Belle-Isle, and many other equally large seas, are frequently frozen over in winter. Nor is this at all extraordinary, for we have found the degree of cold at the surface of the sea, even in summer, to be two degrees below the freezing point; consequently nothing kept it from freezing but the salt it contains, and the agitation of its surface. Whenever this last ceaseth in winter, when the frost is set in, and there comes a fall of snow, it will freeze on the surface as it falls, and in a few days, or perhaps in one night, form such a sheet of ice as will not be easily broken up. Thus a foundation will be laid for it to accumulate to any thickness by falls of snow, without its being at all necessary for the sea-water to freeze. It may be by this means these vast floats of low ice we find in the spring of the year are formed, and which, after they break up, are carried by the currents to the north. For, from all the observations I have been able to make, the currents every where, in the high latitudes, set to the north, or to the N.E. or N.W.; but we have very seldom found them considerable.

If this imperfect account of the formation of these extraordinary floating islands of ice, which is written wholly from my own observations, does not convey some useful hints to an abler pen, it will, however, convey some idea of the lands where they are formed: Lands doomed by Nature to perpetual frigidness; never to feel the warmth of the sun's rays; whose horrible and savage aspect I have not words to describe. Such are the lands we have discovered; what then may we expect those to be which lie still farther to the south? For we may reasonably suppose that we have seen the best, as lying most to the north. If any one should have resolution and perseverance to clear up this point by proceeding farther than I have done, I shall not envy him the honour of the discovery; but I will be bold to say, that the world will not be benefited by it.

I had, at this time, some thoughts of revisiting the place where the French discovery is said to lie. But then I considered that, if they had really made this discovery, the end would be as fully answered as if I had done it myself. We know it can only be an island; and if we may judge from the degree of cold we found in that latitude, it cannot be a fertile one. Besides, this would have kept me two months longer at sea, and in a tempestuous latitude, which we were not in a condition to struggle with. Our sails and rigging were so much worn, that something was giving way every hour; and we had nothing left either to repair or to replace them. Our provisions were in a state of decay, and consequently afforded little nourishment, and we had been a long time without refreshments. My people, indeed, were yet healthy, and would have cheerfully gone wherever I had thought proper to lead them; but I dreaded the scurvy laying hold of them at a time when we had nothing left to remove it. I must say farther, that it would have been cruel in me to have continued the fatigues and hardships they were continually exposed to, longer than was absolutely necessary. Their behaviour, throughout the whole voyage, merited every indulgence which it was in my power to give them. Animated by the conduct of the officers, they shewed themselves capable of surmounting every difficulty and danger which came in their way, and never once looked either upon the one or the other, as being at all heightened, by our separation from our consort the Adventure.

All these considerations induced me to lay aside looking for the French discoveries, and to steer for the Cape of Good Hope; with a resolution, however, of looking for the isles of Denia and Marseveen, which are laid down in Dr Halley's variation chart in the latitude of 41deg 1/2 S., and about 4deg of longitude to the east of the meridian of the Cape of Good Hope. With this view I steered N.E., with a hard gale at N.W. and thick weather; and on the 25th, at noon, we saw the last ice island, being at this time in the latitude of 52deg 52' S., longitude 26deg 31' E.

1775 March

The wind abating and veering to the south, on the first of March, we steered west, in order to get farther from Mr Bouvet's track, which was but a few degrees to the east of us, being at this time in the latitude of 46deg 44' S., longitude 33deg 20' E., in which situation we found the variation to be 23deg 36' W. It is somewhat remarkable, that all the time we had northerly winds, which were regular and constant for several days, the weather was always thick and cloudy; but, as soon as they came south of west, it cleared up, and was fine and pleasant. The barometer began to rise several days before this change happened; but whether on account of it, or our coming northward, cannot be determined.

The wind remained not long at south before it veered round by the N.E. to the N.W., blowing fresh and by squalls, attended, as before, with rain and thick misty weather. We had some intervals of clear weather in the afternoon of the 3d, when we found the variation to be 22deg 26' W.; latitude at this time 45deg 8' S., longitude 30deg 50' E. The following night was very stormy, the wind blew from S.W. and in excessively heavy squalls. At short intervals between the squalls the wind would fall almost to a calm, and then come on again with such fury, that neither our sails nor rigging could withstand it, several of the sails being split, and a middle stay-sail being wholly lost. The next morning the gale abated, and we repaired the damage we had sustained in the best manner we could.

On the 8th, being in the latitude of 41deg 30' S., longitude 26deg 51' E., the mercury in the thermometer rose to 61, and we found it necessary to put on lighter clothes. As the wind continued invariably fixed between N.W. and W., we took every advantage to get to the west, by tacking whenever it shifted any thing in our favour; but as we had a great swell against us, our tacks were rather disadvantageous. We daily saw albatrosses, peterels, and other oceanic birds; but not the least sign of land.

On the 11th, in the latitude of 40deg 40' S., longitude 23deg 47' E., the variation was 20deg 48' W. About noon the same day the wind shifted suddenly from N.W. to S.W., caused the mercury in the thermometer to fall as suddenly from 62deg to 52deg; such was the different state of the air, between a northerly and southerly wind. The next day, having several hours calm, we put a boat in the water, and shot some albatrosses and peterels, which, at this time, were highly acceptable. We were now nearly in the situation where the isles which we were in search of, are said to lie; however, we saw nothing that could give us the least hope of finding them.

The calm continued till five o'clock of the next morning, when it was succeeded by a breeze at W. by S., with which we stood to N.N.W., and at noon observed in latitude 38deg 51' S. This was upwards of thirty miles more to the north than our log gave us; and the watch shewed that we had been set to the east also. If these differences did not arise from some strong current, I know not how to account for them. Very strong currents have been found on the African coast, between Madagascar and the Cape of Good Hope, but I never heard of their extending so far from the land; nor is it probable they do. I rather suppose that this current has no connection with that on the coast; and that we happened to fall into some stream which is neither lasting nor regular. But these are points which require much time to investigate, and must therefore be left to the industry of future navigators.

We were now two degrees to the north of the parallel in which the isles of Denia and Marseveen are said to lie. We had seen nothing to encourage us to persevere in looking after them, and it must have taken up some time longer to find them, or to prove their non-existence. Every one was impatient to get into port, and for good reasons: As for a long time we had had nothing but stale and salt provisions, for which every one on board had lost all relish. These reasons induced me to yield to the general wish, and to steer for the Cape of Good Hope, being at this time in the latitude of 38deg 38' S., longitude 23deg 37' E.

The next day the observed latitude at noon was only seventeen miles to the north of that given by the log; so that we had either got out of the strength of the current, or it had ceased.

On the 15th the observed latitude at noon, together with the watch, shewed that we had had a strong current setting to the S.W., the contrary direction to what we had experienced on some of the preceding days, as hath been mentioned.

At day-light, on the 16th, we saw two sail in the N.W. quarter standing to the westward, and one of them shewing Dutch colours. At ten o'clock we tacked and stood to the west also, being at this time in the latitude of 39deg 9' S., longitude 22deg 38' E.

I now, in pursuance of my instructions, demanded of the officers and petty officers, the log-books and journals they had kept; which were delivered to me accordingly, and sealed up for the inspection of the Admiralty. I also enjoined them, and the whole crew, not to divulge where we had been, till they had their lordships' permission so to do. In the afternoon, the wind veered to the west, and increased to a hard gale, which was of short duration; for, the next day, it

fell, and at noon veered to S.E. At this time we were in the latitude of 34deg 49' S., longitude 22deg E.; and, on sounding, found fifty-six fathoms water. In the evening we saw the land in the direction of E.N.E. about six leagues distant; and, during the fore-part of the night, there was a great fire or light upon it.

At day-break on the 18th, we saw the land again, bearing N.N.W., six or seven leagues distant, and the depth of water forty-eight fathoms. At nine o'clock, having little or no wind, we hoisted out a boat, and sent on board one of the two ships before-mentioned, which were about two leagues from us; but we were too impatient after news to regard the distance. Soon after, a breeze sprung up at west, with which we stood to the south; and, presently, three sail more appeared in sight to windward, one of which shewed English colours.

At one, p.m., the boat returned from on board the Bownkerke Polder, Captain Cornelius Bosch, a Dutch Indiaman from Bengal. Captain Bosch, very obligingly, offered us sugar, arrack, and whatever he had to spare. Our people were told by some English seamen on board this ship, that the Adventure had arrived at the Cape of Good Hope twelve months ago, and that the crew of one of her boats had been murdered and eaten by the people of New Zealand; so that the story which we heard in Queen Charlotte's Sound was now no longer a mystery.

We had light airs next, to a calm till ten o'clock the next morning, when a breeze sprung up at west, and the English ship, which was to windward, bore down to us. She proved to be the True Briton, Captain Broadly, from China. As he did not intend to touch at the Cape, I put a letter on board him for the secretary of the Admiralty.

The account which we had heard of the Adventure was now confirmed to us by this ship. We also got, from on board her, a parcel of old newspapers, which were new to us, and gave us some amusement; but these were the least favours we received from Captain Broadly. With a generosity peculiar to the commanders of the India Company's ships, he sent us fresh provisions, tea, and other articles which were very acceptable, and deserve from me this public acknowledgment. In the afternoon we parted company. The True Briton stood out to sea, and we in for the land, having a very fresh gale at west, which split our fore top-sail in such a manner, that we were obliged to bring another to the yard. At six o'clock we tacked within four or five miles of the shore; and, as we judged, about five or six leagues to the east of Cape Aguilas. We stood off till midnight, when, the wind having veered round to the south, we tacked, and stood along-shore to the west. The wind kept veering more and more in our favour, and at last fixed at E.S.E.; and blew for some hours a perfect hurricane.

As soon as the storm began to subside, we made sail, and hauled in for the land. Next day at noon, the Table Mountain over the Cape Town bore N.E. by E., distant nine or ten leagues. By making use of this bearing and distance to reduce the longitude shewn by the watch to the Cape Town, the error was found to be no more than 18' in longitude, which it was too far to the east. Indeed the difference found between it and the lunar observations, since we left New Zealand, had seldom exceeded half a degree, and always the same way.

The next morning, being with us Wednesday the 22d, but with the people here Tuesday the 21st, we anchored in Table Bay, where we found several Dutch ships; some French; and the Ceres, Captain Newte, an English East India Company's ship, from China, bound directly to England, by whom I sent a copy of the preceding part of this journal, some charts, and other drawings to the Admiralty.

Before we had well got to an anchor, I dispatched an officer to acquaint the governor with our arrival, and to request the necessary stores and refreshments; which were readily granted. As soon as the officer came back, we saluted the garrison with thirteen guns, which compliment was immediately returned with an equal number.

I now learnt that the Adventure had called here, on her return; and I found a letter from Captain Furneaux, acquainting me with the loss of his boat, and of ten of his best men, in Queen Charlotte's Sound. The captain, afterwards, on my arrival in England, put into my hands a complete narrative of his proceedings, from the time of our second and final separation, which I now lay before the public in the following section.

CHAPTER VIII.

Captain Furneaux's Narrative of his Proceedings, in the Adventure, from, the Time he was separated from the Resolution, to his Arrival in England; including Lieutenant Burney's Report concerning the Boat's Crew who were murdered by the Inhabitants of Queen Charlottes Sound.

1773 October

After a passage of fourteen days from Amsterdam, we made the coast of New Zealand near the Table Cape, and stood along-shore till we came as far as Cape Turnagain. The wind then began to blow strong at west, with heavy squalls and

rain, which split many of our sails, and blew us off the coast for three days; in which time we parted company with the Resolution, and never saw her afterwards.

1773 November

On the 4th of November, we again got in shore, near Cape Palliser, and were visited by a number of the natives in their canoes; bringing a great quantity of cray-fish, which we bought of them for nails and Otaheite cloth. The next day it blew hard from W.N.W., which again drove us off the coast, and obliged us to bring-to for two days; during which time it blew one continual gale of wind, with heavy falls of sleet. By this time, our decks were very leaky; our beds and bedding wet; and several of our people complaining of colds; so that we began to despair of ever getting into Charlotte's Sound, or joining the Resolution.

On the 6th, being to the north of the cape, the wind at S.W., and blowing strong, we bore away for some bay to complete our water and wood, being in great want of both, having been at the allowance of one quart of water for some days past; and even that pittance could not be come at above six or seven days longer. We anchored in Tolaga Bay on the 9th, in latitude 38deg 21' S., longitude 178deg 31' east. It affords good riding with the wind westerly, and regular soundings from eleven to five fathoms, stiff muddy ground across the bay for about two miles. It is open from N.N.E. to E.S.E. It is to be observed, easterly winds seldom blow hard on this shore; but when they do, they throw in a great sea, so that if it were not for a great undertow, together with a large river that empties itself in the bottom of the bay, a ship would not be able to ride here. Wood and water are easily to be had, except when it blows hard easterly. The natives here are the same as those at Charlotte's Sound, but more numerous, and seemed settled, having regular plantations of sweet potatoes, and other roots, which are very good; and they have plenty of cray and other fish, which we bought of them for nails, beads, and other trifles, at an easy rate. In one of their canoes we observed the head of a woman lying in state, adorned with feathers and other ornaments. It had the appearance of being alive; but, on examination, we found it dry, being preserved with every feature perfect, and kept as the relic of some deceased relation.

Having got about ten tons of water, and some wood, we sailed for Charlotte's Sound on the 12th. We were no sooner out than the wind began to blow hard, dead on the shore, so that we could not clear the land on either tack. This obliged us to bear away again for the bay, where we anchored the next morning, and rode out a very heavy gale of wind at E. by S., which threw in a very great sea. We now began to fear we should never join the Resolution; having reason to believe she was in Charlotte Sound, and by this time ready for sea. We soon found it was with great difficulty we could get any water, owing to the swell setting in so strong; at last, however, we were able to go on shore, and got both wood and water.

Whilst we lay here we were employed about the rigging, which was much damaged by the constant gales of wind we had met with since we made the coast. We got the booms down on the decks, and having made the ship as snug as possible, sailed again on the 16th. After this we met with several gales of wind off the mouth of the Strait; and continued beating backwards and forwards till the 30th, when we were so fortunate as to get a favourable wind, which we took every advantage of, and at last got safe into our desired port. We saw nothing of the Resolution, and began to doubt her safety; but on going ashore, we discerned the place where she had erected her tents; and, on an old stump of a tree in the garden, observed these words cut out, "Look underneath." There we dug, and soon found a bottle corked and waxed down, with a letter in it from Captain Cook, signifying their arrival on the 3d instant, and departure on the 24th; and that they intended spending a few days in the entrance of the Straits to look for us.

We immediately set about getting the ship ready for sea as fast as possible; erected our tents; sent the cooper on shore to repair the casks; and began to unstow the hold, to get at the bread that was in butts; but on opening them found a great quantity of it entirely spoiled, and most part so damaged, that we were obliged to fix our copper oven on shore to bake it over again, which undoubtedly delayed us a considerable time. Whilst we lay here, the inhabitants came on board as before, supplying us with fish, and other things of their own manufacture, which we bought of them for nails, etc. and appeared very friendly, though twice in the middle of the night they came to the tent, with an intention to steal; but were discovered before they could get any thing into their possession.

1773 December

On the 17th of December, having refitted the ship, completed our water and wood, and got every thing ready for sea, we sent our large cutter, with Mr Rowe, a midshipman, and the boat's crew, to gather wild greens for the ship's company; with orders to return that evening, as I intended to sail the next morning. But on the boat's not returning the same evening, nor the next morning, being under great uneasiness about her, I hoisted out the launch, and sent her with the second lieutenant, Mr Burney, manned with the boat's crew and ten marines, in search of her. My orders to Mr Burney were first, to look well into East Bay, and then to proceed to Grass Cove, the place to which Mr Rowe had been

sent; and if he heard nothing of the boat there, to go farther up the sound, and come back along the west shore. As Mr Rowe had left the ship an hour before the time proposed, and in a great hurry, I was strongly persuaded that his curiosity had carried him into East Bay, none in our ship having ever been there; or else, that some accident had happened to the boat, either by going adrift through the boat-keeper's negligence, or by being stove among the rocks. This was almost every body's opinion; and on this supposition, the carpenter's mate was sent in the launch, with some sheets of tin. I had not the least suspicion that our people had received any injury from the natives, our boats having frequently been higher up, and worse provided. How much I was mistaken, too soon appeared; for Mr Burney having returned about eleven o'clock the same night, made his report of a horrible scene indeed, which cannot be better described than in his own words, which now follow.

"On the 18th, we left the ship; and having a light breeze in our favour, we soon got round Long Island, and within Long Point. I examined every cove, on the larboard hand, as we went along, looking well all around with a spy-glass, which I took for that purpose. At half past one, we stopped at a beach on the left-hand side going up East Bay, to boil some victuals, as we brought nothing but raw meat with us. Whilst we were cooking, I saw an Indian on the opposite shore, running along a beach to the head of the bay. Our meat being drest, we got into the boat and put off; and, in a short time, arrived at the head of this reach, where we saw an Indian settlement."

"As we drew near, some of the Indians came down on the rocks, and waved for us to be gone, but seeing we disregarded them, they altered their notes. Here we found six large canoes hauled up on the beach, most of them double ones, and a great many people; though not so many as one might expect from the number of houses and size of the canoes. Leaving the boat's crew to guard the boat, I stepped ashore with the marines (the corporal and five men), and searched a good many of their houses, but found nothing to give me any suspicion. Three or four well-beaten paths led farther into the woods, where were many more houses; but the people continuing friendly, I thought it unnecessary to continue our search. Coming down to the beach, one of the Indians had brought a bundle of *Hepatoos* (long spears), but seeing I looked very earnestly at him, he put them on the ground, and walked about with seeming unconcern. Some of the people appearing to be frightened, I gave a looking-glass to one, and a large nail to another. From this place the bay ran, as nearly as I could guess, N.N.W. a good mile, where it ended in a long sandy beach. I looked all around with the glass, but saw no boat, canoe, or sign of inhabitant. I therefore contented myself with firing some guns, which I had done in every cove as I went along."

"I now kept close to the east shore, and came to another settlement, where the Indians invited us ashore. I enquired of them about the boat, but they pretended ignorance. They appeared very friendly here, and sold us some fish. Within an hour after we left this place, in a small beach adjoining to Grass Cove, we saw a very large double canoe just hauled up, with two men and a dog. The men, on seeing us, left their canoe, and ran up into the woods. This gave me reason to suspect I should here get tidings of the cutter. We went ashore, and searched the canoe, where we found one of the rullock-ports of the cutter, and some shoes, one of which was known to belong to Mr Woodhouse, one of our midshipmen. One of the people, at the same time, brought me a piece of meat, which he took to be some of the salt meat belonging to the cutter's crew. On examining this, and smelling to it, I found it was fresh. Mr Fannin (the master) who was with me, supposed it was dog's flesh, and I was of the same opinion; for I still doubted their being cannibals. But we were soon convinced by most horrid and undeniable proof."

"A great many baskets (about twenty) lying on the beach, tied up, we cut them open. Some were full of roasted flesh, and some of fern-root, which serves them for bread. On farther search, we found more shoes, and a hand, which we immediately knew to have belonged to Thomas Hill, one of our fore-castle men, it being marked T.H. with an Otaheite tallow-instrument. I went with some of the people a little way up the woods, but saw nothing else. Coming down again, there was a round spot covered with fresh earth, about four feet diameter, where something had been buried. Having no spade, we began to dig with a cutlass; and in the mean time I launched the canoe with intent to destroy her; but seeing a great smoke ascending over the nearest hill, I got all the people into the boat, and made what haste I could to be with them before sun-set."

"On opening the next bay, which was Grass Cove, we saw four canoes, one single and three double ones, and a great many people on the beach, who, on our approach; retreated to a small hill, within a ship's length of the water side, where they stood talking to us. A large fire was on the top of the high land, beyond the woods, from whence, all the way down the hill, the place was thronged like a fair. As we came in, I ordered a musketoon to be fired at one of the canoes, suspecting they might be full of men lying down in the bottom; for they were all afloat, but nobody was seen in them. The savages on the little hill still kept hallooing, and making signs for us to land. However, as soon as we got close in, we all fired. The first volley did not seem to affect them much; but on the second, they began to scramble away as fast as they could, some of them howling. We continued firing as long as we could see the glimpse of any of them through the bushes. Amongst the Indians were two very stout men, who never offered to move till they found themselves forsaken by their companions; and then they marched away with great composure and deliberation; their

pride not suffering them to run. One of them, however, got a fall, and either lay there, or crawled off on all-fours. The other got clear, without any apparent hurt. I then landed with the marines, and Mr Fannin staid to guard the boat."

"On the beach were two bundles of celery, which had been gathered for loading the cutter. A broken oar was stuck upright in the ground, to which the natives had tied their canoes; a proof that the attack had been made here. I then searched all along at the back of the beach, to see if the cutter was there. We found no boat, but instead of her, such a shocking scene of carnage and barbarity as can never be mentioned or thought of but with horror; for the heads, hearts, and lungs of several of our people were seen lying on the beach, and, at a little distance, the dogs gnawing their entrails."

"Whilst we remained almost stupified on the spot, Mr Fannin called to us that he heard the savages gathering together in the woods; on which I returned to the boat, and hauling along-side the canoes, we demolished three of them. Whilst this was transacting, the fire on the top of the hill disappeared; and we could hear the Indians in the woods at high words; I suppose quarrelling whether or no they should attack us, and try to save their canoes. It now grew dark; I therefore just stepped out, and looked once more behind the beach to see if the cutter had been hauled up in the bushes; but seeing nothing of her, returned, and put off. Our whole force would have been barely sufficient to have gone up the hill; and to have ventured with half (for half must have been left to guard the boat) would have been foolhardiness."

"As we opened the upper part of the sound, we saw a very large fire about three or four miles higher up, which formed a complete oval, reaching from the top of the hill down almost to the water-side, the middle space being inclosed all round by the fire, like a hedge. I consulted with Mr Fannin, and we were both of opinion that we could expect to reap no other advantage than the poor satisfaction of killing some more of the savages. At leaving Grass Cove, we had fired a general volley towards where we heard the Indians talking; but, by going in and out of the boat, the arms had got wet, and four pieces missed fire. What was still worse, it began to rain; our ammunition was more than half expended, and we left six large canoes behind us in one place. With so many disadvantages, I did not think it worth while to proceed, where nothing could be hoped for but revenge."

"Coming between two round islands, situated to the southward of East Bay, we imagined we heard somebody calling; we lay on our oars, and listened, but heard no more of it; we hallooed several times, but to little purpose; the poor souls were far enough out of hearing, and, indeed, I think it some comfort to reflect, that in all probability every man of them must have been killed on the spot."

Thus far Mr Burney's report; and to complete the account of this tragical transaction, it may not be unnecessary to mention, that the people in the cutter were Mr Rowe, Mr Woodhouse, Francis Murphy, quarter-master; William Facey, Thomas Hill, Michael Bell, and Edward Jones, fore-castle men; John Cavanaugh, and Thomas Milton, belonging to the after-guard; and James Sevilley, the captain's man, being ten in all. Most of these were of our very best seamen, the stoutest and most healthy people in the ship. Mr Burney's party brought on board two hands, one belonging to Mr Rowe, known by a hurt he had received on it; the other to Thomas Hill, as before-mentioned; and the head of the captain's servant. These, with more of the remains, were tied in a hammock, and thrown over-board, with ballast and shot sufficient to sink it. None of their arms nor cloaths were found, except part of a pair of trowsers, a frock, and six shoes, no two of them being fellows.

I am not inclined to think this was any premeditated plan of these savages; for, the morning Mr Rowe left the ship, he met two canoes, which came down and staid all the fore-noon in Ship Cove. It might probably happen from some quarrel which was decided on the spot, or the fairness of the opportunity might tempt them, our people being so incautious, and thinking themselves too secure. Another thing which encouraged the New Zealanders, was, they were sensible that a gun was not infallible, that they sometimes missed, and that, when discharged, they must be loaded before they could be used again, which time they knew how to take advantage of. After their success, I imagine there was a general meeting on the east side of the sound. The Indians of Shag Cove were there; this we knew by a cock which was in one of the canoes, and by a long single canoe, which some of our people had seen four days before in Shag Cove, where they had been with Mr Rowe in the cutter.

We were detained in the Sound by contrary winds four days after this melancholy affair happened, during which time we saw none of the inhabitants. What is very remarkable, I had been several times up in the same cove with Captain Cook, and never saw the least sign of an inhabitant, except some deserted towns, which appeared as if they had not been occupied for several years; and yet, when Mr Burney entered the cove, he was of opinion there could not be less than fifteen hundred or two thousand people. I doubt not, had they been apprized of his coming, they would have attacked him. From these considerations, I thought it imprudent to send a boat up again; as we were convinced there was not the least probability of any of our people being alive.

On the 23d, we weighed and made sail out of the Sound, and stood to the eastward to get clear of the straits; which we accomplished the same evening, but were baffled for two or three days with light winds, before we could clear the coast. We then stood to the S.S.E. till we got into the latitude of 56deg south, without any thing remarkable happening, having a great swell from the southward. At this time the wind began to blow strong from the S.W., and the weather to be very cold; and as the ship was low and deep laden, the sea made a continual breach over her, which kept us always wet; and by her straining, very few of the people were dry in bed or on deck, having no shelter to keep the sea from them.

The birds were the only companions we had in this vast ocean, except, now and then, we saw a whale or porpoise; and sometimes a seal or two, and a few penguins. In the latitude of 58deg S., longitude 213deg* east, we fell in with some ice, and, every day, saw more or less, we then standing to the east. We found a very strong current setting to the eastward; for by the time we were abreast of Cape Horn, being in the latitude of 61deg S., the ship was a-head of our account eight degrees. We were very little more than a month from Cape Palliser in New Zealand to Cape Horn, which is an hundred and twenty-one degrees of longitude, and had continual westerly winds from S.W. to N.W., with a great sea following.

[* About 147 west longitude, I reckon.]

1774 January

On opening some casks of pease and flour, that had been stowed on the coals, we found them very much damaged, and not eatable; so thought it most prudent to make for the Cape of Good Hope, but first to stand into the latitude and longitude of Cape Circumcision. After being to the eastward of Cape Horn, we found the winds did not blow so strong from the westward as usual, but came more from the north, which brought on thick foggy weather; so that for several days together we could not be able to get an observation, or see the least sign of the sun. This weather lasted above a month, being then among a great many islands of ice, which kept us constantly on the look-out, for fear of running foul of them, and, being a single ship, made us more attentive. By this time our people began to complain of colds and pains in their limbs, which obliged me to haul to the northward to the latitude of 54deg S.; but we still continued to have the same sort of weather, though we had oftener an opportunity of obtaining observations for the latitude.

1774 February

After getting into the latitude above-mentioned, I steered to the east, in order, if possible, to find the land laid down by Bouvet. As we advanced to the east, the islands of ice became more numerous and dangerous; they being much smaller than they used to be; and the nights began to be dark.

1774 March

On the 3d of March, being then in the latitude of 54deg 4' S., longitude 13deg E., which is the latitude of Bouvet's discovery, and half a degree to the eastward of it, and not seeing the least sign of land, either now or since we have been in this parallel, I gave over looking for it, and hauled away to the northward. As our last track to the southward was within a few degrees of Bouvet's discovery in the longitude assigned to it, and about three or four degrees to the southward, should there be any land thereabout, it must be a very inconsiderable island. But I believe it was nothing but ice: As we, in our first setting out, thought we had seen land several times, but it proved to be high islands of ice at the back of the large fields; and as it was thick foggy weather when Mr Bouvet fell in with it, he might very easily mistake them for land.

On the seventh, being in the latitude of 48deg 30' S., longitude 14deg 26' E., saw two large islands of ice.

On the 17th, made the land of the Cape of Good Hope, and on the 19th anchored in Table Bay, where we found Commodore Sir Edward Hughes, with his majesty's ships Salisbury and Sea-horse. I saluted the commodore with, thirteen guns; and, soon after, the garrison with the same number; the former returned the salute, as usual, with two guns less, and the latter with an equal number.

1774 March-July

On the 24th, Sir Edward Hughes sailed with the Salisbury and Sea-horse, for the East Indies; but I remained refitting the ship and refreshing the people till the 16th of April, when I sailed for England, and on the 14th of July anchored at Spithead.

CHAPTER IX.

Transactions at the Cape of Good Hope; with an Account of some Discoveries made by the French; and the Arrival of the Ship at St Helena.

1775 March 22

I now resume my own Journal, which Captain Furneaux's interesting narrative, in the preceding section, had obliged me to suspend.

The day after my arrival at the Cape of Good Hope, I went on shore, and waited on the Governor, Baron Plettenberg, and other principal officers, who received, and, treated us, with the greatest politeness, contributing all in their power to make it agreeable. And, as there are few people more obliging to strangers than the Dutch in general, at this place, and refreshments of all kinds are no where to be got in such abundance, we enjoyed some real repose, after the fatigues of a long voyage.

The good treatment which strangers meet with at the Cape of Good Hope, and the necessity of breathing a little fresh air, has introduced a custom, not common any where else (at least I have no where seen it so strictly observed), which is, for all the officers, who can be spared out of the ship, to reside on shore. We followed this custom. Myself, the two Mr Forsters, and Mr Sparrman, took up our abode with Mr Brandt, a gentleman well known to the English, by his obliging readiness to serve them. My first care, after my arrival, was to procure fresh-baked bread, fresh meat, greens, and wine, for those who remained on board; and being provided, every day during our stay, with these articles, they were soon restored to their usual strength. We had only three men on board whom it was thought necessary to send on shore for the recovery of their health; and for these I procured quarters, at the rate of thirty stivers, or half-a-crown, per day, for which they were provided with victuals, drink, and lodging.

We now went to work to supply all our defects. For this purpose, by permission, we erected a tent on shore, to which we sent our casks and sails to be repaired. We also struck the yards and topmasts, in order to overhaul the rigging, which we found in so bad a condition, that almost every thing, except the standing rigging, was obliged to be replaced with new, and that was purchased at a most exorbitant price. In the article of naval stores, the Dutch here, as well as at Batavia, take a shameful advantage of the distress of foreigners.

That our rigging, sails, etc. should be worn out, will not be wondered at, when it is known, that during this circumnavigation of the globe, that is, from our leaving this place to our return to it again, we had sailed no less than twenty thousand leagues; an extent of voyage nearly equal to three times the equatorial circumference of the earth, and which, I apprehend, was never sailed by any ship in the same space of time before. And yet, in all this great run, which had been made in all latitudes between 9deg and 71, we sprung neither low-masts, top-mast, lower, nor top-sail yard, nor so much as broke a lower or top-mast shroud; which, with the great care and abilities of my officers, must be owing to the good properties of our ship.

One of the French ships which were at anchor in the bay, was the Ajax Indiaman, bound to Pondicherry, commanded by Captain Crozet. He had been second in command with Captain Marion, who sailed from this place with two ships, in March 1772, as hath been already mentioned. Instead of going from hence to America, as was said, he stood away for New Zealand; where, in the Bay of Isles, he and some of his people were killed by the inhabitants. Captain Crozet, who succeeded to the command, returned by the way of the Phillipine Isles, with the two ships, to the island of Mauritius. He seemed to be a man possessed of the true spirit of discovery, and to have abilities. In a very obliging manner he communicated to me a chart, wherein were delineated not only his own discoveries, but also that of Captain Kerguelen, which I found laid down in the very situation where we searched for it; so that I can by no means conceive how both we and the Adventure missed it.

Besides this land, which Captain Crozet told us was a long but very narrow island, extending east and west, Captain Marion, in about the latitude of 48deg south, and from 16deg to 30deg of longitude east of the Cape of Good Hope, discovered six islands, which were high and barren. These, together with some islands lying between the Line and the southern tropic in the Pacific Ocean, were the principal discoveries made in this voyage, the account of which, we were told, was ready for publication.

By Captain Crozet's chart it appeared, that a voyage had been made by the French across the South Pacific Ocean in 1769, under the command of one Captain Surville; who, on condition of his attempting discoveries, had obtained leave to make a trading voyage to the coast of Peru. He fitted out, and took in a cargo, in some part of the East Indies; proceeded by way of the Phillipine Isles; passed near New Britain; and discovered some land in the latitude of 10deg S., longitude 158deg east, to which he gave his own name. From hence he steered to the south; passed, but a few

degrees, to the west of New Caledonia; fell in with New Zealand at its northern extremity, and put into Doubtful Bay; where, it seems, he was, when I passed it, on my former voyage in the Endeavour. From New Zealand Captain Surville steered to the east, between the latitude of 35deg and 41deg south, until he arrived on the coast of America; where, in the port of Callao, in attempting to land, he was drowned.

These voyages of the French, though undertaken by private adventurers, have contributed something towards exploring the Southern Ocean. That of Captain Surville clears up a mistake which I was led into, in imagining the shoals off the west end of New Caledonia, to extend to the west as far as New Holland; it proves that there is an open sea in that space, and that we saw the N.W. extremity of that country.

From the same gentleman, we learnt, that the ship which had been at Otaheite before our first arrival there this voyage, was from New Spain; and that, in her return, she had discovered some islands in the latitude of 32deg S., and under the meridian of 130deg W. Some other islands, said to be discovered by the Spaniards, appeared on this chart; but Captain Crozet seemed to think they were inserted from no good authorities.

We were likewise informed of a later voyage undertaken by the French, under the command of Captain Kerguelen, which had ended much to the disgrace of that commander.

While we lay in Table Bay, several foreign ships put in and out, bound to and from India, viz. English, French, Danes, Swedes, and three Spanish frigates, two of them going to, and one coming from Manilla. It is but very lately that the Spanish ships have touched here; and these were the first that were allowed the same privileges as other European friendly nations.

1775 March-April

On examining our rudder, the pintles were found to be loose, and we were obliged to unhang it, and take it on shore to repair. We were also delayed for want of caulkers to caulk the ship, which was absolutely necessary to be done before we put to sea. At length I obtained two workmen from one of the Dutch ships; and the Dutton English East Indiaman coming in from Bengal, Captain Rice obliged me with two more; so that by the 26th of April this work was finished: And having got on board all necessary stores, and a fresh supply of provisions and water, we took leave of the governor and other principal officers, and the next morning repaired on board. Soon after the wind coming fair, we weighed and put to sea; as did also the Spanish frigate Juno, from Manilla, a Danish Indiaman, and the Dutton.

As soon as we were under sail, we saluted the garrison with thirteen guns; which compliment was immediately returned with the same number. The Spanish frigate and Danish Indiaman both saluted us as we passed them, and I returned each salute with an equal number of guns. When we were clear of the bay the Danish ship steered for the East Indies, the Spanish frigate for Europe, and we and the Dutton for St Helena.

Depending on the goodness of Mr Kendall's watch, I resolved to try to make the island by a direct course. For the first six days, that is, till we got into the latitude of 27deg S., longitude 11deg 1/2 W. of the cape, the winds were southerly and S.E. After this we had variable light airs for two days; they were succeeded by a wind at S.E. which continued to the island, except a part of one day, when it was at N.E. In general the wind blew faint all the passage, which made it longer than common.

1775 May

At day-break in the morning of the 15th of May, we saw the island of St Helena at the distance of fourteen leagues; and at midnight anchored in the road before the town, on the N.W. side of the island. At sun-rise the next morning, the castle, and also the Dutton, saluted us, each with thirteen guns; on my landing, soon after, I was saluted by the castle with the same number, and each of the salutes was returned by the ship.

Governor Skettowe and the principal gentlemen of the island, received and treated me, during my stay, with the greatest politeness; by shewing me every kind of civility in their power.

Whoever views St Helena in its present state, and can but conceive what it must have been originally, will not hastily charge the inhabitants with want of industry. Though, perhaps, they might apply it to more advantage, were more land appropriated to planting of corn, vegetables, roots, etc. instead of being laid out in pasture, which is the present mode. But this is not likely to happen, so long as the greatest part of it remains in the hands of the company and their servants. Without industrious planters, this island can never flourish, and be in a condition to supply the shipping with the necessary refreshments.

Within these three years a new church has been built; some other new buildings were in hand; a commodious landing-place for boats has been made; and several other improvements, which add both strength and beauty to the place.

During our stay here, we finished some necessary repairs of the ship, which we had not time to do at the Cape. We also filled all our empty water-casks; and the crew were served with fresh beef, purchased at five-pence per pound. Their beef is exceedingly good, and is the only refreshment to be had worth mentioning.

By a series of observations made at the Cape town, and at James Fort in St Helena, at the former by Messrs Mason and Dixon, and at the latter by Mr Maskelyne, the astronomer royal, the difference of longitude between these two places is 24deg 12' 15", only two miles more than Mr Kendall's watch made. The lunar observations made by Mr Wales, before we arrived at the island, and after we left it, and reduced to it by the watch, gave 5deg 51' for the longitude of James Fort; which is only five miles more west than it is placed by Mr Maskelyne. In like manner the longitude of the Cape Town was found within 5' of the truth. I mention this to shew how near the longitude of places may be found by the lunar method, even at sea, with the assistance of a good watch.

CHAPTER X.

Passage from St Helena to the Western Islands, with a Description of the Island of Ascension and Fernando Noronha.

1775 May

On the 21st in the evening, I took leave of the governor, and repaired on board. Upon my leaving the shore, I was saluted with thirteen guns; and upon my getting under sail, with the Dutton in company, I was saluted with thirteen more; both of which I returned.

After leaving St Helena, the Dutton was ordered to steer N.W. by W. or N.W. by compass, in order to avoid falling in with Ascension; at which island, it was said, an illicit trade was carried on between the officers of the India Company's ships, and some vessels from North America, who, of late years, had frequented the island on pretence of fishing whales or catching turtle, when their real design was to wait the coming of the India ships. In order to prevent their homeward-bound ships from falling in with these smugglers, and to put a stop to this illicit trade, the Dutton was ordered to steer the course above-mentioned, till to the northward of Ascension. I kept company with this ship till the 24th, when, after putting a packet on board her for the Admiralty, we parted: She continuing her course to the N.W., and I steering for Ascension.

In the morning of the 28th I made the island; and the same evening anchored in Cross Bay on the N.W. side, in ten fathoms water, the bottom a fine sand, and half a mile from the shore. The Cross Hill, so called on account of a cross, or flag-staff erected upon it, bore by compass S. 38deg E.; and the two extreme points of the bay extended from N.E. to S.W. We remained here till the evening of the 31st, and notwithstanding we had several parties out every night, we got but twenty-four turtle, it being rather too late in the season; however, as they weighed between four or five hundred pounds each, we thought ourselves not ill off. We might have had a plentiful supply of fish in general, especially of that sort called Old Wives, of which I have no where seen such abundance. There were also cavalies, conger eels, and various other sorts; but the catching of any of these was not attended to, the object being turtle. There are abundance of goats, and aquatic birds, such as men-of-war and tropic birds, boobies, etc.

The island of Ascension is about ten miles in length, in the direction of N.W. and S.E., and about five or six in breadth. It shews a surface composed of barren hills and vallies, on the most of which not a shrub or plant is to be seen for several miles, and where we found nothing but stones and sand, or rather flags and ashes; an indubitable sign that the isle, at some remote time, has been destroyed by a volcano, which has thrown up vast heaps of stones, and even hills. Between these heaps of stones we found a smooth even surface, composed of ashes and sand, and very good travelling upon it; but one may as easily walk over broken glass bottles as over the stones. If the foot deceives you, you are sure to be cut or lamed, which happened to some of our people. A high mountain at the S.E. end of the isle seems to be left in its original state, and to have escaped the general destruction. Its soil is a kind of white marl, which yet retains its vegetative qualities, and produceth a kind of purslain, spurge, and one or two grasses. On these the goats subsist, and it is at this part of the isle where they are to be found, as also land-crabs, which are said to be very good.

I was told, that about this part of the isle is some very good land on which might be raised many necessary articles; and some have been at the trouble of sowing turnips and other useful vegetables. I was also told there is a fine spring in a valley which disjoins two hills on the top of the mountain above-mentioned; besides great quantities of fresh water in holes in the rocks, which the person who gave me this information, believed was collected from rains. But these

supplies of water can only be of use to the traveller; or to those who may be so unfortunate as to be shipwrecked on the island; which seems to have been the fate of some not long ago, as appeared by the remains of a wreck we found on the N.E. side. By what we could judge, she seemed to have been a vessel of about one hundred and fifty tons burthen.

While we lay in the road, a sloop of about seventy tons burthen came to an anchor by us. She belonged to New York, which place she left in February, and having been to the coast of Guinea with a cargo of goods, was come here to take in turtle to carry to Barbadoes. This was the story which the master, whose name was Greves, was pleased to tell, and which may, in part, be true. But I believe the chief view of his coming here, was the expectation of meeting with some of the India ships. He had been in the island near a week, and had got on board twenty turtle. A sloop, belonging to Bermuda, had sailed but a few days before with one hundred and five on board, which was as many as she could take in; but having turned several more on the different sandy beaches, they had ripped open their bellies, taken out the eggs, and left their carcasses to putrify; an act as inhuman as injurious to those who came after them. Part of the account I have given of the interior parts of this island I received from Captain Greves, who seemed to be a sensible intelligent man, and had been all over it. He sailed in the morning of the same day we did.

Turtle, I am told, are to be found at this isle from January to June. The method of catching them is to have people upon the several sandy bays, to watch their coming on shore to lay their eggs, which is always in the night, and then to turn them on their backs, till there be an opportunity to take them off the next day. It was recommended to us to send a good many men to each beach, where they were to lie quiet till the turtle were ashore, and then rise and turn them at once. This method may be the best when the turtle are numerous; but when there are but few, three or four men are sufficient for the largest beach; and if they keep patrolling it, close to the wash of the surf, during the night, by this method they will see all that come ashore, and cause less noise than if there were more of them. It was by this method we caught the most we got; and this is the method by which the Americans take them. Nothing is more certain, than that all the turtle which are found about this island, come here for the sole purpose of laying their eggs; for we met with none but females; and of all those which we caught, not one had any food worth mentioning in its stomach; a sure sign, in my opinion, that they must have been a long time without any; and this may be the reason why the flesh of them is not so good as some I have eat on the coast of New South Wales, which were caught on the spot where they fed.

The watch made 8deg 45' difference of longitude between St Helena and Ascension; which, added to 5deg 49' the longitude of James Fort in St Helena, gives 14deg 34' for the longitude of the Road of Ascension, or 14deg 30' for the middle of the island, the latitude of which is 8deg S. The lunar observations made by Mr Wales, and reduced to the same point of the island by the watch, gave 14deg 28' 30" west longitude.

On the 31st of May, we left Ascension, and steered to the northward with a fine gale at S.E. by E. I had a great desire to visit the island of St Matthew, to settle its situation; but as I found the wind would not let me fetch it, I steered for the island of Fernando de Noronha on the coast of Brazil, in order to determine its longitude, as I could not find this had yet been done. Perhaps I should have performed a more acceptable service to navigation, if I had gone in search of the island of St Paul, and those shoals which are said to lie near the equator, and about the meridian of 20deg W.; as neither their situation nor existence are well known. The truth is, I was unwilling to prolong the passage in searching for what I was not sure to find; nor was I willing to give up every object, which might tend to the improvement of navigation or geography, for the sake of getting home a week or a fortnight sooner. It is but seldom that opportunities of this kind offer; and when they do, they are too often neglected.

In our passage to Fernando de Noronha, we had steady fresh gales between the S.E. and E.S.E., attended with fair and clear weather; and as we had the advantage of the moon, a day or night did not pass without making lunar observations for determining our longitude. In this run, the variation of the compass gradually decreased from 11deg W., which it was at Ascension., to 1deg W., which we found off Fernando de Noronha. This was the mean result of two compasses, one of which gave 1deg 37', and the other 23' W.

1775 June

On the 9th of June at noon we made the island of Fernando de Noronha, bearing S.W. by W. 1/2 W., distant six or seven leagues, as we afterwards found by the log. It appeared in detached and peaked hills, the largest of which looked like a church tower or steeple. As we drew near the S.E. part of the isle, we perceived several unconnected sunken rocks lying near a league from the shore, on which the sea broke in a great surf. After standing very near these rocks, we hoisted our colours, and then bore up round the north end of the isle, or rather round a group of little islets; for we could see that the land was divided by narrow channels. There is a strong fort on the one next the main island, where there are several others; all of which seemed to have every advantage that nature can give them, and they are so disposed, as wholly to command all the anchoring and landing-places about the island. We continued to steer round

the northern point, till the sandy beaches (before which is the road for shipping) began to appear, and the forts and the peaked hills were open to the westward of the said point. At this time, on a gun being fired from one of the forts, the Portuguese colours were displayed, and the example was followed by all the other forts. As the purpose for which I made the island was now answered, I had no intention to anchor; and therefore, after firing a gun to leeward, we made sail and stood away to the northward with a fine fresh gale at E.S.E. The peaked hill or church tower bore S., 27deg W., distant about four or five miles; and from this point of view it leans, or overhangs, to the east. This hill is nearly in the middle of the island, which no where exceeds two leagues in extent, and shews a hilly unequal surface, mostly covered with wood and herbage.

Ulloa says, "This island hath two harbours capable of receiving ships of the greatest burden; one is on the north side, and the other is on the N.W. The former is, in every respect, the principal, both for shelter and capacity, and the goodness of its bottom; but both are exposed to the north and west, though these winds, particularly the north, are periodical, and of no long continuance." He further says, that you anchor in the north harbour (which is no more than what I would call a road) to thirteen fathoms water, one-third of a league from shore, bottom of fine sand; the peaked hill above-mentioned bearing S.W. 2deg southerly.*

[* See Don Antonio d'Ulloa's Book, vol. ii. chap. 3. page 95 to 102, where there is a very particular account of this island.]

This road seems to be well sheltered from the south and east winds. One of my seamen had been on board a Dutch India ship, who put in at this isle in her way out in 1770. They were very sickly, and in want of refreshments and water. The Portuguese supplied them with some buffaloes and fowls; and they watered behind one of the beaches in a little pool, which was hardly big enough to dip a bucket in. By reducing the observed latitude at noon to the peaked hill, its latitude will be 3deg 53' S.; and its longitude, by the watch, carried on from St Helena, is 32deg 34' W.; and by observations of the sun and moon, made before and after we made the Isle, and reduced to it by the watch, 32deg 44' 30" W. This was the mean result of my observations. The results of those made by Mr Wales, which were more numerous, gave 32deg 23'. The mean of the two will be pretty near the watch, and probably nearest the truth. By knowing the longitude of this isle, we are able to determine that of the adjacent east coast of Brazil; which, according to the modern charts, lies about sixty or seventy leagues more to the west. We might very safely have trusted to these charts, especially the variation chart for 1744, and Mr Dalrymple's of the southern Atlantic ocean*.

[* Ulloa says, that the chart places this island sixty leagues from the coast of Brazil; and that the Portuguese pilots, who often make the voyage, judge it to be eighty leagues; but, by taking the mean between the two opinions, the distance may be fixed at seventy leagues.]

On the 11th, at three o'clock in the afternoon, we crossed the equator in the longitude of 32deg 14' W. We had fresh gales at E.S.E., blowing in squalls, attended by showers of rain, that continued at certain intervals, till noon the next day, after which we had twenty-four hours fair weather.

At noon on the 13th, being in the latitude of 3deg 49' N., longitude 31deg 47' W., the wind became variable, between the N.E. and S.; and we had light airs and squalls by turns, attended by hard showers of rain, and for the most part dark gloomy weather, which continued till the evening of the 15th, when, in the latitude of 5deg 47' N., longitude 31deg W., we had three calm days, in which time we did not advance above ten or twelve leagues to the north. We had fair weather and rain by turns; the sky, for the most part, being obscured, and sometimes by heavy dense clouds which broke in excessive hard showers.

At seven o'clock in the evening on the 18th, the calm was succeeded by a breeze at east, which the next day increasing and veering to and fixing at N.E., we stretched to N.W. with our tacks on board. We made no doubt that we had now got the N.E. trade-wind, as it was attended with fair weather, except now and then some light showers of rain; and as we advanced to the north the wind increased, and blew a fresh top-gallant gale.

On the 21st, I ordered the still to be fitted to the largest copper, which held about sixty-four gallons. The fire was lighted at four o'clock in the morning, and at six the still began to run. It was continued till six o'clock in the evening; in which time we obtained thirty-two gallons of fresh water, at the expence of one bushel and a half of coals; which was about three-fourths of a bushel more than was necessary to have boiled the ship's company's victuals only; but the expence of fuel was no object with me. The victuals were dressed in the small copper, the other being applied wholly to the still; and every method was made use of to obtain from it the greatest quantity of fresh water possible; as this was my sole motive for setting it to work. The mercury in the thermometer at noon was eighty-four and a half, and higher it is seldom found at sea. Had it been lower, more water, under the same circumstances, would undoubtedly have been produced; for the colder the air is, the cooler you can keep the still, which will condense the steam the faster. Upon the

whole, this is an useful invention; but I would advise no man to trust wholly to it. For although you may, provided you have plenty of fuel and good coppers, obtain as much water as will support life, you cannot, with all your efforts, obtain sufficient to support health, in hot climates especially, where it is the most wanting: For I am well convinced, that nothing contributes more to the health of seamen, than having plenty of water.

The wind now remained invariably fixed at N.E. and E.N.E., and blew fresh with squalls, attended with showers of rain, and the sky for the most part cloudy. On the 25th, in the latitude of 16deg 12' N., longitude 37deg 20' W., seeing a ship to windward steering down upon us, we shortened sail in order to speak with her; but finding she was Dutch by her colours, we made sail again and left her to pursue her course, which we supposed was to some of the Dutch settlements in the West Indies. In the latitude of 20deg N., longitude 39deg 45' W., the wind began to veer to E. by N. and E.; but the weather remained the same; that is, we continued to have it clear and cloudy by turns, with light squalls and showers. Our track was between N.W. by N. and N.N.W., till noon on the 28th, after which our course made good was N. by W., being at this time in the latitude of 21deg 21' N., longitude 40deg 6' W. Afterwards, the wind began to blow a little more steady, and was attended with fair and clear weather. At two o'clock in the morning of the 30th, being in the latitude of 24deg 20' N., longitude 40deg 47' W., a ship, steering to the westward, passed us within hail. We judged her to be English, as they answered us in that language; but we could not understand what they said, and they were presently out of sight.

In the latitude of 29deg 30', longitude 41deg 30', the wind slackened and veered more to the S.E. We now began to see some of that sea-plant, which is commonly called gulph-weed, from a supposition that it comes from the Gulph of Florida. Indeed, for aught I know to the contrary, it may be a fact; but it seems not necessary, as it is certainly a plant which vegetates at sea. We continued to see it, but always in small pieces, till we reached the latitude 36deg, longitude 39deg W., beyond which situation no more appeared.

1775 July

On the 5th of July, in the latitude of 22deg 31' 30" N., longitude 40deg 29' W., the wind veered to the east, and blew very faint: The next day it was calm; the two following days we had variable light airs and calms by turns; and, at length, on the 9th, having fixed at S.S.W., it increased to a fresh gale, with which we steered first N.E. and then E.N.E., with a view of making some of the Azores, or Western Isles. On the 11th, in the latitude of 36deg 45' N., longitude 36deg 45' W., we saw a sail which was steering to the west; and the next day we saw three more.

CHAPTER XI.

Arrival of the Ship at the Island of Fayal, a Description of the Place, and the Return of the Resolution to England.

1775 July

At five o'clock in the evening of the 13th, we made the island of Fayal, one of the Azores, and soon after that of Pico, under which we spent the night in making short boards. At day-break the next morning, we bore away for the bay of Fayal, or De Horta, where at eight o'clock, we anchored in twenty fathoms water, a clear sandy bottom, and something more than half a mile from the shore. Here we moored N.E. and S.W., being directed so to do by the master of the port, who came on board before we dropped anchor. When moored, the S.W. point of the bay bore S. 16deg W., and the N.E. point N. 33deg E.; the church at the N.E. end of the town N. 38deg W., the west point of St George's Island N. 42deg E., distant eight leagues; and the isle of Pico, extending from N. 74deg E. to S. 46deg E., distant four or five miles.

We found in the bay the *Pourvoyeur*, a large French frigate, an American sloop, and a brig belonging to the place. She had come last from the river Amazon, where she took in a cargo of provision from the Cape Verd Islands; but, not being able to find them, she steered for this place, where she anchored about half an hour before us.

As my sole design in stopping here was to give Mr Wales an opportunity to find the rate of the watch, the better to enable us to fix with some degree of certainty the longitude of these islands, the moment we anchored, I sent an officer to wait on the English consul, and to notify our arrival to the governor, requesting his permission for Mr Wales to make observations on shore, for the purpose above mentioned. Mr Dent, who acted as consul in the absence of Mr Gathorne, not only procured this permission, but accommodated Mr Wales with a convenient place in his garden to set up his instruments; so that he was enabled to observe equal altitudes the same day.

We were not more obliged to Mr Dent for the very friendly readiness he shewed in procuring us this and every other thing we wanted, than for the very liberal and hospitable entertainment we met with at his house, which was open to accommodate us both night and day.

During our stay, the ship's company was served with fresh beef; and we took on board about fifteen tons of water, which we brought off in the country boats, at the rate of about three shillings per ton. Ships are allowed to water with their own boats; but the many inconveniencies attending it, more than overbalance the expence of hiring shore-boats, which is the most general custom.

Fresh provisions for present use may be got, such as beef, vegetables, and fruit; and hogs, sheep, and poultry for sea stock, all at a pretty reasonable price; but I do not know that any sea-provisions are to be had, except wine. The bullocks and hogs are very good, but the sheep are small and wretchedly poor.

The principal produce of Fayal is wheat and Indian corn, with which they supply Pico and some of the other isles. The chief town is called Villa de Horta. It is situated in the bottom of the bay, close to the edge of the sea, and is defended by two castles, one at each end of the town, and a wall of stone-work, extending along the sea-shore from the one to the other. But these works are suffered to go to decay, and serve more for shew than strength. They heighten the prospect of the city, which makes a fine appearance from the road; but, if we except the Jesuits' college, the monasteries and churches, there is not another building that has any thing to recommend it, either outside or in. There is not a glass window in the place, except what are in the churches, and in a country-house which lately belonged to the English consul; all the others being latticed, which, to an Englishman, makes them look like prisons.

This little city, like all others belonging to the Portuguese, is crowded with religious buildings, there being no less than three convents of men and two of women, and eight churches, including those belonging to the convents, and the one in the Jesuits' college. This college is a fine structure, and is situated on an elevation in the pleasantest part of the city. Since the expulsion of that order, it has been suffered to go to decay, and will probably, in a few years, be no better than a heap of ruins.

Fayal, although the most noted for wines, does not raise sufficient for its own consumption. This article is raised on Pico, where there is no road for shipping; but being brought to De Horta, and from thence shipped abroad, chiefly to America, it has acquired the name of Fayal Wine.

The bay, or road of Fayal, is situated at the east end of the isle, before the Villa de Horta, and facing the west end of Pico. It is two miles broad, and three quarters of a mile deep, and hath a semi-circular form. The depth of water is from twenty to ten and even six fathoms, a sandy bottom, except near the shore, and particularly near the S.W. head, off which the bottom is rocky, also without the line which joins the two points of the bay, so that it is not safe to anchor far out. The bearing before mentioned, taken when at anchor, will direct any one to the best ground. It is by no means a bad road, but the winds most to be apprehended, are those which blow from between the S.S.W. and S.E.; the former is not so dangerous as the latter, because, with it, you can always get to sea. Besides this road, there is a small cove round the S.W. point, called Porto Pierre, in which, I am told, a ship or two may lie in tolerable safety, and where they sometimes heave small vessels down.

A Portuguese captain told me, that about half a league from the road in the direction of S.E., in a line between it and the south side of Pico, lies a sunken rock, over which is twenty-two feet water, and on which the sea breaks in hard gales from the south. He also assured me, that of all the shoals that are laid down in our charts and pilot-books about these isles, not one has any existence but the one between the islands of St Michael and St Mary, called Hormingan. This account may be believed, without relying entirely upon it. He further informed me, that it is forty-five leagues from Fayal to the island of Flores; and that there runs a strong tide between Fayal and Pico, the flood setting to the N.E. and the ebb to the S.W., but that, out at sea, the direction is E. and W. Mr Wales having observed the times of high and low water by the shore, concluded that it must be high water at the full and change, about twelve o'clock, and the water riseth about four or five feet.

The distance between Fayal and Flores was confirmed by Mr Rebiers, lieutenant of the French frigate, who told me, that after being by estimation two leagues due south of Flores, they made forty-four leagues on a S.E. by E. course by compass, to St Catherine's Point on Fayal.

I found the latitude of the ship at anchor 38deg 31' 55" N. in the bay

By a mean of seventeen sets of lunar 28 24 30 W. observations, and reduced to the bay by the watch, the longitude was made

By a mean of six sets after leaving it, 28 53 22
and reduced back by the watch

Longitude by observation 28 38 56

Ditto, by the watch 28 55 45

Error of the watch on our arrival at 16 26-1/2
Portsmouth

True longitude by the watch 28 39 18-1/2

I found the variation of the compass, by several azimuths, taken by different compasses on board the ship, to agree very well with the like observations made by Mr Wales on shore; and yet the variation thus found is greater by 5deg than we found it to be at sea, for the azimuths taken on board the evening before we came into the bay, gave no more than 16deg 18' W. variation, and the evening after we came out 17deg 33' W.

I shall now give some account of the variation, as observed in our run from the island of Fernando De Noronha to Fayal. The least variation we found was 37' W. which was the day after we left Fernando De Noronha, and in the latitude of 33' S., longitude 32deg 16' W. The next day, being nearly in the same longitude, and in the latitude of 1deg 25' N., it was 1deg 23' W.; and we did not find it increase till we got into the latitude of 5deg N., longitude 31deg W. After this our compasses gave different variation, viz. from 3deg 57' to 5deg 11' W. till we arrived in the latitude of 26deg 44' N., longitude 41deg W., when we found 6deg W. It then increased gradually, so that in the latitude of 35deg N., longitude 40deg W., it was 10deg 24' W.; in the latitude of 38deg 12' N., longitude 32deg 1/2 W. it was 14deg 47'; and in sight of Fayal 16deg 18' W., as mentioned above.

Having left the bay, at four in the morning of the 19th, I steered for the west end of St George's Island. As soon as we had passed it, I steered E. 1/2 S. for the Island of Tercera; and after having run thirteen leagues, we were not more than one league from the west end. I now edged away for the north side, with a view of ranging the coast to the eastern point, in order to ascertain the length of the island; but the weather coming on very thick and hazy, and night approaching, I gave up the design, and proceeded with all expedition for England.

On the 29th, we made the land near Plymouth. The next morning we anchored at Spithead; and the same day I landed at Portsmouth, and set out for London, in company with Messrs Wales, Forsters, and Hodges.

Having been absent from England three years and eighteen days, in which time, and under all changes of climate, I lost but four men, and only one of them by sickness, it may not be amiss, at the conclusion of this journal, to enumerate the several causes to which, under the care of Providence, I conceive this uncommon good state of health, experienced by my people, was owing.

In the Introduction, mention has been made of the extraordinary attention paid by the Admiralty in causing such articles to be put on board, as either from experience or suggestion it was judged would tend to preserve the health of the seamen. I shall not trespass upon the reader's time in mentioning them all, but confine myself to such as were found the most useful.

We were furnished with a quantity of malt, of which was made *Sweet Wort*. To such of the men as shewed the least symptoms of the scurvy, and also to such as were thought to be threatened with that disorder, this was given, from one to two or three pints a-day each man; or in such proportion as the surgeon found necessary, which sometimes amounted to three quarts. This is, without doubt, one of the best anti-scorbutic sea-medicines yet discovered; and, if used in time, will, with proper attention to other things, I am persuaded, prevent the scurvy from making any great progress for a considerable while. But I am not altogether of opinion that it will cure it at sea.

Sour Krout, of which we had a large quantity, is not only a wholesome vegetable food, but, in my judgment, highly antiscorbutic; and it spoils not by keeping. A pound of this was served to each man, when at sea, twice-a-week, or oftener, as was thought necessary.

Portable Broth was another great article, of which we had a large supply. An ounce of this to each man, or such other proportion as circumstances pointed out, was boiled in their pease, three days in the week; and when we were in places where vegetables were to be got, it was boiled with them, and wheat or oatmeal, every morning for breakfast; and also with pease and vegetables for dinner. It enabled us to make several nourishing and wholesome messes, and was the means of making the people eat a greater quantity of vegetables than they would otherwise have done.

Rob of Lemon and Orange is an antiscorbutic we were not without. The surgeon made use of it in many cases with great success.

Amongst the articles of victualling, we were supplied with *Sugar* in the room of *Oil*, and with *Wheat* for a part of our *Oatmeal*; and were certainly gainers by the exchange. Sugar, I apprehend, is a very good antiscorbutic; whereas oil (such as the navy is usually supplied with), I am of opinion, has the contrary effect.

But the introduction of the most salutary articles, either as provisions or medicines, will generally prove unsuccessful, unless supported by certain regulations. On this principle, many years experience, together with some hints I had from Sir Hugh Palliser, Captains Campbell, Wallis, and other intelligent officers, enabled me to lay a plan, whereby all was to be governed.

The crew were at three watches, except upon some extraordinary occasions. By this means they were not so much exposed to the weather as if they had been at watch and watch; and had generally dry clothes to shift themselves, when they happened to get wet. Care was also taken to expose them as little to wet weather as possible.

Proper methods were used to keep their persons, hammocks, bedding, cloaths, etc. constantly clean and dry. Equal care was taken to keep the ship clean and dry betwixt decks. Once or twice a week she was aired with fires; and when this could not be done, she was smoked with gun-powder, mixed with vinegar or water. I had also, frequently, a fire made in an iron pot, at the bottom of the well, which was of great use in purifying the air in the lower parts of the ship. To this, and to cleanliness, as well in the ship as amongst the people, too great attention cannot be paid; the least neglect occasions a putrid and disagreeable smell below, which nothing but fires will remove.

Proper attention was paid to the ship's coppers, so that they were kept constantly clean.

The fat which boiled out of the salt beef and pork, I never suffered to be given to the people; being of opinion that it promotes the scurvy.

I was careful to take in water wherever it was to be got, even though we did not want it, because I look upon fresh water from the shore to be more wholesome than that which has been kept some time on board a ship. Of this essential article we were never at an allowance, but had always plenty for every necessary purpose. Navigators in general cannot, indeed, expect, nor would they wish to meet with such advantages in this respect, as fell to my lot. The nature of our voyage carried us into very high latitudes. But the hardships and dangers inseparable from that situation, were in some degree compensated by the singular felicity we enjoyed, of extracting inexhaustible supplies of fresh water from an ocean strewed with ice.

We came to few places, where either the art of man, or the bounty of nature, had not provided some sort of refreshment or other, either in the animal or vegetable way. It was my first care to procure whatever of any kind could be met with, by every means in my power; and to oblige our people to make use thereof, both by my example and authority; but the benefits arising from refreshments of any kind soon became so obvious, that I had little occasion, to recommend the one, or to exert the other.

It doth not become me to say how far the principal objects of our voyage have been obtained. Though it hath not abounded with remarkable events, nor been diversified by sudden transitions of fortune; though my relation of it has been more employed in tracing our course by sea, than in recording our operations on shore; this, perhaps, is a circumstance from which the curious reader may infer, that the purposes for which we were sent into the Southern Hemisphere, were diligently and effectually pursued. Had we found out a continent there, we might have been better enabled to gratify curiosity; but we hope our not having found it, after all our persevering researches, will leave less room for future speculation about unknown worlds remaining to be explored.

But, whatever may be the public judgment about other matters, it is with real satisfaction, and without claiming any merit but that of attention to my duty, that I can conclude this account with an observation, which facts enable me to make; that our having discovered the possibility of preserving health amongst a numerous ship's company, for such a length of time, in such varieties of climate, and amidst such continued hardships and fatigues, will make this voyage remarkable in the opinion of every benevolent person, when the disputes about a Southern Continent shall have ceased to engage the attention, and to divide the judgment of philosophers.

(Tables of the route of the Resolution and the Adventure, the variation of the compass and meteorological observations during the voyage.)

* * * * *

A VOCABULARY OF THE LANGUAGE OF THE SOCIETY ISLES.

DIRECTIONS FOR THE PRONUNCIATION OF THE VOCABULARY.

As all nations who are acquainted with the method of communicating their ideas by characters, (which represent the sound that conveys the idea,) have some particular method of managing, or pronouncing, the sounds represented by such characters, this forms a very essential article in the constitution of the language of any particular nation, and must, therefore, be understood before we can make any progress in learning, or be able to converse in it. But as this is very complex and tedious to a beginner, by reason of the great variety of powers the characters, or letters, are endued with under different circumstances, it would seem necessary, at least in languages which have never before appeared in writing, to lessen the number of these varieties, by restraining the different sounds, and always representing the same simple ones by the same character; and this is no less necessary in the English than any other language, as this variety of powers is very frequent, and without being taken notice of in the following Vocabulary, might render it entirely unintelligible. As the vowels are the regulations of all sounds, it is these only that need be noticed, and the powers allotted to each of these in the Vocabulary is subjoined.

A in the English language is used to represent two different simple sounds, as in the word Arabia, where the first and last have a different power from the second. In the Vocabulary this letter must always have the power, or be pronounced like the first and last in Arabia. The other power, or sound, of the second *a*, is always represented in the Vocabulary by *a* and *i*, printed in Italics thus, *ai*.

E has likewise two powers, or it is used to represent two simple sounds, as in the words Eloquence, Bred, Led, etc. and it may be said to have a third power, as in the words Then, When, etc. In the first case, this letter is only used at the beginning of words, and wherever it is met with in any other place in the words of the Vocabulary, it is used as in the second case: But never as in the third example; for this power, or sound, is every where expressed by the *a* and *i* before-mentioned, printed in Italics.

I is used to express different simple sounds, as in the words Indolence, Iron, and Imitation. In the Vocabulary it is never used as in the first case, but in the middle of words; it is never used as in the second example, for that sound is always represented by *y*, nor is it used as in the last case, that sound being always represented by two *e*'s, printed in Italics in this manner, *ee*.

O never alters in the pronunciation, i.e. in this Vocabulary, of a simple sound, but is often used in this manner, *oo*, and sounds as in Good, Stood, etc.

U alters, or is used to express different simple sounds, as in Unity, or Umbrage. Here the letters *e* and *u*, printed in Italics *eu* are used to express its power as in the first example, and it always retains the second power, wherever it is met with.

Y is used to express different sounds, as in My, By, etc. etc. and in Daily, Fairly, etc. Wherever it is met with in the middle, or end, (i.e. anywhere but at the beginning,) of a word, it is to be used as in the first example; but is never to be found as in the second, for that sound, or power, is always represented by the Italic letter *e*. It has also a third power, as in the words Yes, Yell, etc., which is retained every where in the Vocabulary, at least in the beginning of words, or when it goes before another vowel, unless directed to be sounded separately by a mark over it, as thus, *y a*.

Unless in a few instances, these powers of the vowels are used throughout the Vocabulary; but, to make the pronunciation still less liable to change, or variation, a few marks are added to the words, as follows:--

This mark as *oa*, means that these letters are to be expressed singly.

The letters in Italic, as *ee*, or *oo*, make but one simple sound.

When a particular stress is laid on any part of a word in the pronunciation, an accent is placed over that letter where it begins, or rather between that and the preceding one.

It often happens that a word is compounded as it were of two, or in some cases the same word, or syllable, is repeated. In these circumstances, a comma is placed under them at this division, where a rest, or small space, of time is left before you proceed to pronounce the other part, but it must not be imagined that this is a full stop.

Examples in all these Cases.

Roa, Great, long, distant. E'r_ee_ma, Five. Ry'po_ee_a, Fog, or mist. E'h_oo_ra, To invert, or turn upside

down. Par_oo_, r_oo_, A partition, *division, or screen.*

A VOCABULARY, etc.

A.

To abide, *or remain* Ete'ei.

An Abode, *or place of residence*, Noho`ra.

Above, *not below*, N_eea_, s. Tie'n_eea_.

An Abscess, Fe'fe.

Action, *opposed to rest*, Ta'er_ee_.

Adhesive, *of an adhesive or sticking*

quality Oo'p_ee_re.

Adjoining, *or contiguous to*, E'p_ee_iho.

Admiration, *an interjection of*, A'w_ai_, s. A'w_ai_ to P_ee_r_ee_ai.

An adulterer, T_ee_ho t_ee_ho, s. Teeho *or one that vexes a married woman* ta-rar

To agitate, *or shake a thing,*

as water, etc. E_oo_a'w_ai_.

Aliment, *or food of any kind*, Maa.

Alive, *that is not dead*, Waura.

All, *the whole, not a part*, A'ma_oo_.

Alone, *by one's self*, Ota'h_oi_.

Anger, *or to be angry*, Warrad_ee_, s. R_ee_d_ee_.

To angle, *or fish*, E'h_oo_tee.

The Ankle, Momoa.

The inner Ankle, A't_oo_a,ewy.

Answer, *an answer to a question*, Oo'm_ai_a.

Approbation, *or consent*, Mad_oo_ho'why.

Punctuated Arches *on the hips*, Evar're.

The Arm, R_ee_ma.

The Armpit, E'e.

An arrow, E'oo_me.

Arrow, *the body of an arrow or reed*, O'wha.

The point of an Arrow, To'ai, s. O'moa.

Ashamed, *to be ashamed or confused*, Ama, s. He'ama.

Ashore, *or on shore*, Te Euta.

To ask *for a thing*, Ho'my, s. Ha'py my.

Asperity, *roughness*, Tarra, tarra.

An Assassin, *murderer, or rather man-killer, soldier, Taata, Toa. or warrior,*

An Assembly, *or meeting*, Ete_ou_'rooa. Atherina, A'n_ai_h_eu_.

Avaricious, *parsimonious, ungenerous*, P_ee_'p_ee_re.

Averse, *unwillingness to do a thing*, Fata, h_oi_to'_hoi_to.

Authentic, *true*, Par_ou_, m_ou_.

Awake, *not asleep*, Arra arra, s. Era.

Awry, *or to one side; as a wry neck*, Na'na.

An Axe, *hatchet, or adze*, Toe.

Ay, *yes; an affirmation*, Ai.

B.

A Babe, *or child*, Mydidde.

A Batchelor, *or unmarried person*, E'ev_ee_ (taata.)

The Back, T_oo_a_.

To wipe the Backside, Fy'r_oo_,too'ty.

Bad, *it is not good*, 'Ee'no.
 A Bag *of straw*, Ete'oe, s. Eate.
 Bait, *for fish*, Era' eu_noo.
 Baked *in the oven*, Et_oo_n_oo_.
 Bald-headed, O_o_po'b_oo_ta.
 Bamboo, E_e_n_ee'ou_.
 A Bank, *or shoal*, Epaa.
 Bare, *naked, applied to a person that is undressed*, Ta'turra.
 The Bark *of a tree*, Ho'hore.
 Barren land, Fe'nooa Ma'_ou_re.
 A large round Basket *of twig*, He'na.
 A small Basket *of cocoa leaves*, V_ai_'hee.
 A long Basket *of cocoa leaves*, Apo'_ai_ra.
 A Basket *of plantain stock*, Papa' M_aiee_a.
 A fisher's Basket, Er're'vy.
 A round Basket *of cocoa leaves*, Mo'ene.
 A Bastard, Fanna T_oo_'n_ee_a.
 Bastinado, *to bastinate or flog a person*, Tapra'h_ai_.
 To bathe, Ob'oo.
 A Battle, *or fight*, Emotto.
 A Battle-axe, O'morre.
 To bawl, *or cry aloud*, T_ei_mo'toro.
 A Bead, Poe.
 The Beard, _Oo_me_oo_me.
 To beat *upon, or strike a thing*, T_oo_'py or T_oo_'ba_ee_.
 To beat *a drum*, Er_oo_'k_oo_.
 To beckon *a person with the hand*, Ta'rappe.
 A Bed, *or bed-place*, Ero_ee_, s. Moi'a.
 To bedaub, *or bespatter*, Pa'ry.
 A Bee, Erao.
 A Beetle, P_ee_re'te_ee_.
 Before, *not behind*, Te'moa.
 A Beggar, *a person that is troublesome*, Tapa'r_oo_.
 continually asking for some-what,
 Behind, *not before*, Te'm_oo_r_ee_.
 To belch, Er_oo_'y.
 Below, *as below stairs*, Tei'dirro, s. T_ee_diraro.
 Below, *underneath, far below*, O'raro.
 To bend *any thing, as a stick*, etc. Fa'fe'fe.
 Benevolence, *generosity*, Ho'roa,
 e.g. *you are a generous man*, Taata ho roa oe.
 Between, *in the middle, betwixt two*, Fero'p_oo_.
 To bewail, *or lament by crying*, Etat_ee_.
 Bigness, *largeness, great*, Ara'hay.
 A Bird, Manoo.
 A Bitch, _Oo_re, e'_oo_ha.
 To bite, *as a dog*, A ah_oo_.
 Black, *colour*, Ere, ere.
 Bladder, Toa meeme.
 A Blasphemer, *a person who speaks T_oo_na, (t_aa_ta.)*
disrespectfully of their deities,
 Blind, Matta-po.
 A Blister, *raised by a burn or*
other means, Mei'ee.
 Blood, Toto, s. Eh_ooei_.
 To blow *the nose*, Fatte.
 The blowing, *or breathing of a whale*, Ta'hora.
 Blunt, *as a blunt tool of any sort*, Ma'n_ee_a.

The carved Boards of a Maray, Era.
A little Boat, or canoe, E'vaa.
 A Boil, Fe'fe.
 Boldness, Eaw_ou_.
 A Bone, E'ev_ee_.
 A Bonetto, *a fish so called*, Peera'ra.
 To bore *a hole*, Ehoo'ee, s. Eh_oo_'o.
 A Bow, E'fanna.
 A Bow-string, Aroa'h_oo_a.
 To bow *with the head*, Etoo'o.
A young Boy, My'didde.
 Boy, *a familiar way of speaking*, He'aman_ee_.
 The Brain *of any animal*, A b_oo_ba.
 A Branch *of a tree or plant*, E'ama.
 Bread-fruit, *or the fruit of the bread-tree*, _Oo_r_oo_.
 Bread-fruit, *a particular sort of it*, E'patea.
 An insipid paste *of Bread-fruit*, Eh'oe.
 _The gum of the _Bread-tree, Tappo'_oo_r_oo_.
 The leaf *of the Bread-tree*, E'da'_oo_r_oo_.
 The pith *of the Bread-tree*, Po'_oo_r_oo_.
 To break *a thing*, O whatte, s. Owhan ne,
 s. Fatte.
 The Breast, O'ma
 A Breast-plate *made of twigs, ornamented with feathers, dog's hair, Ta_oo_me and pearl-shell*,
 To breathe, Watte Weete wee
 te,'aho.
 Bring, *to ask one to bring a thing*, Ho'my.
 Briskness, *being brisk or quick*, T_ee_t_ee_re.
 Broiled, *or roasted, as broiled meat*, _Oo_aw_ee_ra.
 Broken, *or cut*, 'Mot_oo_.
 The Brow, *or forehead*, E'ry.
 A brown colour, Aur_au_ra.
 Buds *of a tree or plant*, Te, arre ha_oo_.
 A Bunch *of any fruit*, Eta.
 To burn *a thing*, Dood_oo_e.
 A Butterfly, Pepe.

c.

To call *a person at a distance*, T_oo_o t_oo_'o_oo_.
 A Calm, Man_ee_no.
 A Calm, *or rather to be so placed, that the wind has no access to you*, E_ou_, shea.
 Sugar Cane, To, Etoo.
 A Cap, *or covering for the head* T_au_'matta.
 To carry *any thing*, Ea'mo.
 To carry *a person on the back*, Eva'ha.
 Catch *a thing hastily with the hand*, Po'po_ee_, s. Peero.
 as a fly, etc.
 To catch *a ball*, Ama'wh_ee_a.
 To catch *fish with a line*, Eh_oo_te.
 A Caterpillar, Et_oo_a.
 Celerity, *swiftness*, T_ee'teere, s. E'tirre.
 The Centre, *or middle of a thing*, Tera'p_oo_.
 Chalk, Mamma'tea.
 A Chatterer, *or noisy impertinent* Taata Em_oo_,

fellow_, s. E'm_oo_.
 Cheerfulness, Wara.
 The Cheek, Pappar_ee_a.
 A Chest, 'P_ee_ha.
 The Chest, *or body*, O'p_oo_.
 To chew, *or eat*, E'y.
 Chequered, *or painted in squares*, P_oo_re, p_oo_re.
 A Chicken, Moa pee'ri_a_ia.
 A Chief, *or principal person; one of Earee.*
the first rank among the people,
An inferior Chief, _or one who
 is only in an independent state, T_oo'ou_
 a gentleman_,
 Child-bearing, Fanou, e'vaho.
 Children's *language*, Father, O'pucen_oo_, *and* Papa.
 Mother, E'wh_ei_arre, *and* O'pa'tea.
 Brother, E'tama.
 Sister, Te't_oo_a.
 The Chin, *and lower jaw*, E'taa.
 Choaked, _to be choaked as with Ep_oo_'n_ei_na,
 victuals_, etc. s. Er_oo_'y.
 To chuse, *or pick out*, Eh_ee_e,te,me,my ty.
 Circumcision, *or rather an incision* E_oo_re,te h_ai_.
of the foreskin,
A sort of Clappers, used at funerals, Par'ha_oo_.
 Clapping *the bend of the arm smartly* E'too.
with the hand, so as to make a noise,
an Indian custom,
 The Claw *of a bird*, A'ee oo.
 Clay, *or clammy earth*, Ewh_ou_,arra.
 Clean, *not nasty*, Oo'ma, s. Eoo'ee.
 Clear, *pure; as clear water*, etc. Tea'te.
 White clayey Cliffs, Emammatea.
 Close, *shut*, Eva'h_ee_.
 Cloth *of any kind, or rather the covering Ahoo.*
or raiments made of it,
A piece of oblong Cloth, slit in the
middle, through which the head is Teeboota.
put, and it then hangs down behind
and before,
 Brown thin Cloth, Oo'erai.
 Dark-brown Cloth, Poo'h_ee_re.
 Nankeen-coloured Cloth, Ah_ee_re, s. _Oo_a.
 Gummed Cloth, Oo'_ai_r ara.
 Heappa,heappa, s.
 Yellow Cloth, A'ade, p_oo ee ei_, s.
 Oora poo'ee ei.
 Cloth, _a piece of thin white cloth Par_oo_'y, by which name
 wrapt round the waist, or thrown they also call a white
 over the shoulders_, shirt.
 A Cloth-beater, *or an oblong square* To'aa.
piece of wood grooved, and used in
making cloth,
 The _Cloth-plant, _a sort of mulberry Ea_ou_te.
 tree_,
 A Cloud, E'ao, s. Ea_oo_.
 A Cock, Moa, e'toa.
 Cock, *the cock claps his wings* Te Moa Pa_ee_, pa_ee_.
 A Cock-roach, Potte potte.

A Cocoa-nut, A'r_ee_.
The fibrous husk of a Cocoa-nut, P_oo_r_oo_'waha,
 s. P_oo_r_oo_.
 Cocoa-nut oil, Erede,vae.
 Cocoa leaves, E,ne'ha_oo_.
 Coition, E'y.
The sense of Cold, Ma'r_ee_de.
 A Comb, Pa'horu, s. Pa'herre.
 Company, *acquaintance, gossips, Tee'ya.*
 Compliance *with a request, consent, Mad_oo_,ho'why.*
 Computation, *or counting of numbers, Ta't_ou_.*
 A Concubine, Wa'h_ei_ne Moebo,
 s. Etoo'n_ee_a.
 Confusedness, *without order, E'vah_ee_a.*
 Consent, *or approbation, Mad_oo_,ho'why.*
 Contempt, *a name of contempt given Wah_ei_ne,p_oo_'ha.*
 to a maid, or unmarried woman_,
 Conversation, Para_ou_,maro, s.
 Para'para_ou_.
A sort of Convolvulus, or bird-weed,
common in the islands, Oh_oo_e.
 Cook'd, *dress'd; not raw, Ee'oo, s. E_ee_'wera.*
 To Cool *one with a fan, Taha'r_ee_.*
 Cordage *of any kind, Taura.*
 The Core *of an apple, Boe.*
 A Cork, *or stopper of a bottle or gourd*
shell, Ora'h_oo_e.
 A Corner, E'pecho.
 Covering, *the covering of a fish's gills, Pe_ee_'eya.*
 Covetousness, *or rather one not inclined*
to give, Pee,peere.
 A Cough, Ma're.
 To Court, *woo a woman, Ta'raro.*
 Coyness *in a woman, No'noa.*
 A Crab, Pappa.
 Crab, *a large land-crab that climbs*
the cocoa-nut trees for fruit, E_oo_wa.
 A Crack, cleft, or fissure, Mot_oo_.
 Crammed, *lumbered, crowded, Ooa,p_ee_a'pe,s.Ehotto.*
 The Cramp, Emo't_oo_t_oo_.
 A Cray-fish, O'_oo_ra.
 To Creep *on the hands and feet, Ene'ai.*
 Crimson colour, _Oo_ra_oo_ra.
 Cripple, *lame, T_ei_'t_ei_.*
 Crooked, *not straight, O_o_o'p_ee_o.*
 To crow *as a cock, A'a_oo_a.*
 The Crown *of the head, T_oo_'p_oo_e.*
 To cry, *or shed tears, Ta_ee_.*
A brown Cuckoo, with black bars and
a long tail, frequent in the isles, Ara'were_wa_.
 To cuff, *or slap the chops, E'par_oo_.*
 Curlew, *a small curlew or whimbrel*
found about the rivulets, Torea.
 Cut, *or divided, Mot_oo_.*
To cut the hair with scissors, O'tee.

D.

A Dance, H_ee_va.

Darkness, Poe'r_ee_,
 s. Po_oo_'r_ee_
 To Darn O'ono
 A Daughter, Ma'h_ei_ne.
 Day, *or day-light*, Mara'marama, s.
 A'ou, s. A'a_ou_.
 Day-break, Oota'tah_ei_ta.
 Day, *to-day*, A_oo_'n_ai_.
 Dead, Matte roa.
A natural Death, Matte noa.
 Deafness, Ta'r_ee_a, t_oo_r_ee_.
 Decrepid, Epoo't_oo_a.
 Deep water, Mona'.
 A Denial, *or refusal*, Eh_oo_'noa.
 To desire, *or wish for a thing*, E_ooee_.
 A Devil, *or evil spirit*, Et_ee_.
 Dew, Ahe'a_oo_.
 A Diarrhoea, *or looseness*, Hawa, hawa.
 To dip *meat in salt water instead of* Eaw_ee_'wo
salt, (an Indian custom,)
 Dirt, *or nastiness of any kind*, Erepo.
 Disapprobation, Eh_oo_noa.
 A Disease, _where the head cannot be Ep_ee_.
 held up, perhaps the palsy_.
 To disengage, *untie or loosen*, Ea_oo_'w_ai_.
 Dishonesty, E_ee_'a.
 Displeased, _to be displeased, vexed, or Ta_ee_'va.
 in the dumps_.
 Dissatisfaction, _to grumble, or be Fa_oo_'oue.
 dissatisfied_.
 Distant, *far off*, Roa.
 To distort, _or writhe the limbs, body, Fae'e'ta.
 lips, etc.
 To distribute, *divide or share out*, At_oo_'ha.
 A District, Matei na.
 A Ditch, Eo'h_oo_.
 To dive *under water*, Eho'p_oo_.
 A Dog, Oo'r_ee_.
 A Doll *made of cocoa-plants*, Ad_oo_'a.
 A Dolphin, A'_ou_na.
 Done, *have done; or that is enough*, A'teera.
or there is no more,
 A Door, Oo'b_oo_ta.
 Double, *or when two things are in* Tau'r_oo_a.

 Respiration, *breathing*, T_oo_e,t_oo_e.
 A Rib, Awao.
 Rich, *not poor, having plenty of Epo'too.*
goods, etc.
 A Ring, 'M_ai_no.
 The Ringworm, *a disease so called*, En_oo_a.
 Ripe, *as ripe fruit, etc.* Para, s. Pai, s. Ooo
 p_ai_.
 Rise, *to rise up*, A'too.
 To rive, *or split*, Ewha_oo'_wha_oo_.
 A Road, *or path*, Ea'ra.
 Roasted, *or broiled*, _Oo_a'w_ai_ra.
 A Robber, *or thief*, E_ee_'a (taata.)
 A Rock, Pa_oo_.
A reef of Rocks, Ea_ou_.
 Rolling, *the rolling of a ship*, T_oo_'r_oo_re.
 A Root, Ap_oo_, s. Ea.
 A Rope *of any kind*, Taura.
 Rotten, *as rotten fruit, etc.* R_oo_pe.
 Rough, *not smooth*, Ta'rra, tarra.
 To row *with oars*, E'_oo_mē, s, E'hoē.
 To rub *a thing*, as in washing the hands Ho'ro_ee_.
 and face_.
 The Rudder *of a boat, or steering Hoe,fa'herre.*
paddle of a canoe,
 Running *backwards and forwards*, Oo'atapone.
endeavouring to escape,

s.

The Sail *of a ship or boat*, E_ee_'ai.
 To sail, *or to be under sail*, E'whano.
 Salt, *or salt water*, Ty'ty, s. Meede.
 Sand, *dust*, E'one.
 Saturn, Whati'hea.
 Saunders's *island*, Tab_oo_a, Manoo.
 A Saw, E_ee'oo_.
 A Scab, E'tona.
A fish's Scale or scales, Poa.
A pair of Scissars, O't_oo_bo,
 s. O'tob_oo_.
 A Scoop, *to empty water from a canoe*, E'tata.
 To scrape *a thing*, Oo'a_oo_.
 To scratch *with the fingers*, Era'ra_oo_.
 Scratched, *a scratched metal, etc.* Pah_oo_re'h_oo_re.
 The Sea-cat, *a fish so called*, P_oo_he.
 The Sea, Ta_ee_, s. M_ee_de.
 A Sea-egg, He'awy.
 A Seam *between two planks*, Fatoo'wh_ai_ra.
 To search *for a thing that is lost*, Oo,s.Pae'm_ee_.
 A Seat, Papa.
 Secret, *a secret whispering, or slandering*
another, Ohe'm_oo_.

The Seed *of a plant*, H_oo_a't_oo_t_oo_,
 s. Ehoero
 The sense *of seeing*, E'h_ee_'o.
 To send, Eho'poe.
 A Sepulchre, *or burying-place*, Ma'ray.
 A Servant, T_ow_t_ow_.
 Seven, A'H_ee_t_oo_.
 To sew, *or string*, E't_oo_e.
 Seyne, *to haul a seyne*, Etoroo te p_ai_a.
 Shady, Mar_oo_,maroo.
 To shake, *or agitate a thing*, E_oo_a'wai.
 A Shark, Mao.
 Sharp, *not blunt*, Oo'ee.
 To shave, *or take off the beard*, Eva'r_oo_,
 s. Whanne, whanne.
 A small Shell, Ot'eo.
 A tyger Shell, Pore'h_oo_.
 Shew *it me*, Enara.
 A Ship, P_a_hee.
 Shipwreck, Ara'wha.
 A white Shirt, Par_oo_'y.
 To shiver *with cold*, A'tete.
 Mud Shoes, *or fishing shoes*, Tama.
 The Shore, Euta.
 Short, Po'potoo.
 Shut, *not open*, Opa'h_ee_,
 s. Poo'peepe.
 Sickness, Matte my Mamy.
 The left Side, A'r_oo_de.
 The Side, E'reea'wo.
 The right Side, Atou,a'taou.
 Sighing, Fa'ea.
 Silence, Fatte'b_oo_a.
 Similar, *or alike*, _Oo_why'a'da.
 To sink, A'tomo.
 A Sister, T_oo_'h_ei_ne.
 To sit *down*, A'noho.
 To sit *cross-legged*, T_ee_'py.
 Six, A'Hon_oo_.
 A Skate-fish, E'wha_ee_.
 The Skin, E'e'ree.
 The Sky, Era_ee_.
 To sleep, Moe.
 The long Sleep, *or death*, Moe roa.
 To sleep, *when sitting*, T_oo_'roore,moe.
 A Sling, E'ma.
 Slow, Marra,marroa,s.Fate.
 Small, *little*, _Ee_te.
 The sense *of smelling*, Fata't_oo_,
 s. _Oo_too,too,too.
 Smell *it*, H_oi_na.
 To smell, Ahe'oi.
 Smoke, E'_oo_ra.
 Smooth, Pa'ya.
 Smutting *the face with charcoal for
 funeral ceremonies*, Bap'para.
 A sea Snake, *that has alternate
 rings of a white and black colour*, P_oo_h_ee_'ar_oo_.
 To snatch *a thing hastily*, E'h_ai_r_oo_.

Sneezing, Mach_ee_'ai.
 Snipe, *a bird resembling a snipe, of a black and brown colour*, T_ee_'t_ee_.
 Snot 'H_oo_pe.
 Sobemess, *sobriety, sober, not given to drunkenness*, T_ei_r_ei_da.
 To soften, Epar_oo_'par_oo_.
 Softness, *that is, not hard*, Maroo.
 The Sole *of the foot*, Tap_oo_'y.
 A Son My'de.
 A Son-in-law, H_oo_'noa.
 A Song, Heeva.
 A Sore, *or ulcer*, O'pai.
 Soreness, *or pain*, Ma'may.
 Sound, *any sound that strikes the ear*, Pa'_ee_na.
 A Span, Ewhae ono.
 To speak, Paraou.
 Speak; *he speaks not from the heart*, Neeate_oo_t_oo_te parou
 his words are only on his lips_, no nona.
 A Spear, *or lance*, Tao.
 To spill, Emare.
 To spit, Too't_oo_a.
 To spread, *or to expand a thing, as Ho'hora. cloth, etc.*
 To squeeze, *or press hard*, Ne,'ne_ee_.
 To squeeze, *or press gently with the hand*, Roro'm_ee_.
 Squint-eyed, Matta'areva.
A fighting Stage in a boat, E't_oo_t_ee_.
 To stamp *with the feet, to trample on Tata'hy. a thing*,
 Stand up, Atearenona.
 A Star, Ef'ai_too, s. Hwettoo.
 A Star-fish, Eve'r_ee_.
 To startle, *as when one dreams* Wa'hee, te'dirre.
 Stay, *or wait a little*, A'r_ee_a, s. Ar_ee_'ana.
 To steal, 'Woreedo.
 Steep, *as steep rocks, or cliffs*, Mato.
 A walking Stick, 'Tame.
 Stinking, *ill-smelled, as stinking water; etc.* Na'm_oo_a,
 s. N_ee_'n_ee_o.
 Stink, *to stink or smell ill*, F_ou_, f_ou_.
 To stink, *as excrement*, P_ee_ro, p_ee_ro.
 The Stomach, 'Para_ee_'a.
 A Stone, Owhay.
 A polished Stone, used to beat victuals P_ai_'noo.
 into a paste_,
 Stones, *upright stones which stand on the paved area before huts*, T_oo_'t_oo_re.
 A small Stool, *to lay the head on when asleep*, Papa, s. Papa, r_oo_a.
 Stool, *to go to stool*, T_ee_t_ee_'o.
 To stop, A'too.
 The Stopper *of a quiver*, Ponau.
 A Storm *of wind, rain, thunder, etc.* Tarooa.
 Strait, *narrow, not wide*, P_ee_re, peere.
 Striking, *hollow striking in dancing*, Ap_ee_.
 The String *of a quiver*, E'aha.
 Strong, *as a strong man*, _O'o_mara.
 Struck, A'b_oo_l_a_.

Stupidity, *ignorance*, W_ee_a'l_a_.
 To suck *as a child*, Ote,ote.
 Sugar *cane*, E'To, s. Too.
 Suicide, Euha'a_ou_.
 Sultry, *or hot air*, Poh_ee_a.
 The Sun, Mahanna, s. Era.
The meridian Sun, T_ei 'n_ee_a te Mahanna.
 Supine, *lying*, Fateeraha.
 Surf *of the sea*, Horo'w_ai_.
An interjection of Surprise,
or admiration, Allaheuee'ai.
 To surround, A'b_oo_ne.
 To swallow, Horo'm_ee_.
 The Sweat *of the body*; *or to sweat* Eh_ou_, s. Eh_ou_h_ou_.
 A sweet *taste*, Mona.
 Swell *of the sea*, Er_oo_.

T.

A Tail, Ero.
 A Tail *of a bird*, E'hoppe.
 To take *a friend by the hand*, Etoo'ya_oo_.
 To take *off, or unloose*, Eve'vette.
 To take *care of the victuals*, Ewhaapoo te maa.
 To talk, *or converse*, Paraou.
The sense of tasting, Tama'ta.
 A Tetotum, *or whirligig*, E'piroa.
 To tear *a thing*, Ha'hy, s. Whatte.
 A Teat, *or dug*, E'oo.
 The Teeth, E'n_ee_h_ee_o.
 Ten A'h_oo_r_oo_.
 To tend, *or feed hogs*, Ew_h_a_ee_te Boa.
 Tenants, Af_eu 'h_au_.
A black Tern, with a whitish head, O_ee_'o.
 There, Te'raee.
 They, *them, or theirs*, To'ta_oo_a.
 Thickness, *applied to solid bodies*, Meoo'meoo.
 Thick, *as thick cloth*, etc. T_oo_e'too'e.
 Thick, *muddy*, Ewore'r_oo_,s.Eworepe.
 Thine, *it is yours, or belongs to you*, No oe.
 Thirst, W'ah_ee_'y.
 Thoughts, Para_ou_, no te o'p_oo_.
An appearance of thoughtfulness, Fate'b_oo_a.
 Three, Tor_oo_.
 The Throat, Ara'poa.
 To throw, *or heave a thing*, Taora.
 To throw *a thing away*, Harre'wai.
 To throw *a ball*, Ama'h_oo_a.
 To throw *a lance*, Evara'towha.
 Throw, *shall I throw it*, Taure'a'a.
 Throwing *in dancing*, Hoe'aire.
 The Thumb, Er_ee_ma,erahi.
 Thunder, Pa't_ee_re.
 Tickle, *to tickle a person*, My'n_ee_na.
 A Tide, *or current*, A'ow.
 To tie *a knot*, Ty.
 Time, *a space of time, from 6 to 10*
at night, O't_oo_e, teepo.
 Time, *a little time, a small space*, Popo'_eu_n_oo_.

Time, *a long time, a great while*, Ta'moo.
 A Title *belonging to a woman of frank*, E'tapay'r_oo_.
 A Toe *of the foot*, Man_ee_o.
 A Tomb, T_oo_pap'pou.
 The Tongue, Erero.
 A Tortoise, Ehon_oo_.
 Touching, Fa'fa.
 Tough, *as tough meat*, etc. Ah_oo_'ou_e.
 A Town, E'farre p_oo_to p_oo_t_oo_.
 To trample *with the foot*, Tata'he, s. Ta'ta'hy.
 A Tree, Erao.
 A Tree, *from which they make clubs, Toa (Erao.) spears*, etc.
 To tremble, *or shudder with cold*, _Oo_a'titte, s. Eta.
 Trembling, *shaking*, A_ou_'dou.
 To trip *one up in wrestling*, Me'hae.
 A Tropic-bird, Man_oo_'roa.
 Truth, Eva_ee_'roa, s. Para_ou_mou.
 To tumble, P_ou_ta'heite.
 A Turban, E'tae.
 To turn, *or turned*, Oo'ahoe.
 To turn, *as in walking backwards and forwards*, H_oo_d_ee_p_ee_pe.
 Twins, *twin children*, Ma'hea.
 To twist *a rope*, Taw_ee_'r_ee_.
 Two, E'Rooa.

u.

An Ulcer, *or sore*, O'p_ai_.
 Under, *below, low down*, Oraro.
 Under *sail*, P_ou_'pou_ee_.
 To understand, Ee'te.
 To undress, *or take off the clothes*, Ta'turra.
 An unmarried *person*, Ar_ee_'oi.
 Unripe, *as unripe fruit*, etc. P_oo_.

v.

Luminous Vapour, Epao. Vással, *or subject*, Manna'h_ou_na. Vást, Ara,hai,s.Mai,ara'hai. The Vèins *that run under the skin*, E'w_ou_a. Vénus, T_ou_'r_oo_a. Vèssel, *any hollow vessel, as cups of nuts*, etc. Ai'boo. Vèssel, *a hollow vessel in which they prepare an inebriating liquor*, Oo'mutte. To vomit, Er_oo_'y.

w.

Wad, *tow, fibres like hemp*, Ta'm_ou_.
 Wait, *stay a little*, Areeana.
 Wake, *awake*, Arra arra, s. Era.
 To walk out, Avou_'oi_a.
 To walk *backwards and forwards*, H_oo_a p_ee_pe.
 A Warrior, *soldier; or rather a man-killer*, Taatatoa.
 Warmth, *heat*, Mahanna,hanna.
 A Wart, Toria.
 To wash, *as to wash cloth in water*, Mare.
 To watch, Eteae.
 Water, A'vy.
 Water-cresses, Pa'toa.
 We, *both of us*, Ta_oo_a, s. Ar_oo_'r_oo_a.
 A wedge, Era'h_ei_.

To weep, *or cry*, Hano a,a,ta_ee_.
 Well *recovered, or well escaped*, Woura, s. woo,ara.
 Well, *it is well, charming, fine*, P_oo_ro'too.
 What, *whats that*, E'hara, E'ha'rya,s.
 Ye'ha_ee_a, expressed
 inquisitively.
 What *do you call that, what is the
 name of it*, Owy te a_ee_'oa.
 When, *at what time*, W'heea.
 Where *is it*, Te'hea.
 Whet, *to whet or sharp a thing*, Evo_ee_.
 To whistle, Ma'p_oo_.
 Whistling, *a method of whistling to
 call the people to meals*, Ep_ou_,maa.
 To whisper *secretly, as in backbiting*, etc. Ohe'm_oo_.
 Who *is that, what is he called*, Owy,tanna, s.
 Owy,nana.
 Whole, *the whole not a part of a thing*, Eta,e'tea, s. A'ma_oo_.
 Wide, *not strait or narrow*, Whatta,whatta.
 A Widow, Wa't_oo_ neea.
 Wife, *my wife*, Ma'h_ei_ne.
 The Wind, Mattay.
The south-east Wind, Mattaee.
 A Window, Ma'laee ou'panee.
 The Wing *of a bird*, Ere'ou.
 To wink, E'am_ou_,am_oo_.
 To wipe *a thing clean*, Ho'ro_ee_.
 Wish, *a wish to one who sneezes*, Eva'r_ou_a t Eat_oo_a.
 Within *side*, T_ee_'ro to.
 A Woman, Wa'h_ei_ne.
A married Woman, Wa'h_ei_ne mou.
 Woman, *she is a married woman, she
 has got another husband*, Terra,tanne.
 Won't *I won't do it*, 'A_eeoo_, expressed
 angrily.
 Wood *of any kind*, Erao.
 A Wound, Oo't_ee_.
 A Wrestler, M_ou_na.
 Wrinkled *in the face*, M_ee_o, m_ee_o.
 The Wrist, Mo'moa.
 A Wry-neck, Na'na.

Y.

To yawn, Ha'mamma.
 Yellow *colour*, He'appa.
 Yes, Ay, s. ai.
 Yesterday, Ninna'hay.
 Yesternight, Ere'po.
 York *island*, Ei'meo.
 Yon Oe.
 young, *as a young animal of any kind*, P_ee_'n_ai_a.

A TABLE EXHIBITING AT ONE VIEW, SPECIMENS OF DIFFERENT LANGUAGES SPOKEN IN THE SOUTH-SEA, FROM EASTER ISLAND, WESTWARD TO NEW CALEDONIA, AS OBSERVED IN THE VOYAGE.

English. Otaheite. Easter Island.
 The Marquesas Isles. The Island of Amsterdam. New Zealand.

LETTER FROM JOHN IBBETSON, ESQ.

Secretary to the Commissioners of Longitude,

T0

Sir JOHN PRINGLE, Baronet, P.R.S.

SIR,

The Earl of Sandwich, and the other Commissioners for the Discovery of Longitude at Sea, etc. who were present at a late meeting at this place, having expressed to you a desire that the very learned and ingenious Discourse upon some late Improvements of the Means for preserving the Health of Mariners, which was delivered by you at the Anniversary Meeting of the Royal Society, on the 30th of November last night, with Captain Cook's Paper therein referred to, be printed, and annexed to the Account of the Astronomical and Philosophical Observations made in the course of the said Captain Cook's late voyages which account is preparing for the press, under their direction; and it having been since thought more proper that the said Discourse and Paper should be annexed to the Second Volume of the Account of that Voyage, which is shortly to be published, by order of the Board of Admiralty, I have, therefore, the direction of the Earl of Sandwich, First Commissioner of that Board, as well as of the Board of Longitude, to acquaint you therewith, and to desire you will please to permit your said Discourse, with the Paper therein referred to, to be printed, and annexed to the Second Volume of the Account of the said Voyage accordingly.

I am, with great Regard and Esteem,

SIR,

Your most obedient humble Servant,

ADMIRALTY,
March 15, 1777.
JOHN IBBETSON.

A DISCOURSE UPON SOME LATE IMPROVEMENTS OF THE MEANS FOR PRESERVING THE HEALTH OF MARINERS.

DELIVERED AT THE Anniversary Meeting of the ROYAL SOCIETY,
November 30, 1776.
By Sir JOHN PRINGLE, Baronet,
PRESIDENT,

CORRECTED BY THE AUTHOR.

GENTLEMEN,

Before we proceed further in the business of this day, permit me to acquaint you with the judgment of your Council, in the disposal of Sir Godfrey Copley's medal; an office I have undertaken at their request, and with the greater satisfaction, as I am confident you will be no less unanimous in giving your approbation, than they have been in addressing you for it upon this occasion. For though they were not insensible of the just title that several of the Papers, composing the present volume of your Transactions, had to your particular notice, yet they did not hesitate in preferring that which I presented to you from Captain Cook, giving An account of the method he had taken to preserve the health of the crew of his Majesty's ship the Resolution during her late voyage round the world*. Indeed I imagine that the name alone of so worthy a member of this society would have inclined you to depart from the strictness of your rules, by conferring upon him that honour, though you had received no direct communication from him; considering how meritorious in your eyes that person must appear, who hath not only made the most extensive, but the most instructive voyages; who hath not only discovered, but surveyed, vast tracts of new coasts; who hath dispelled the illusion of a terra australis incognita, and fixed the bounds of the habitable earth, as well as those of the navigable ocean, in the southern hemisphere.

[* The paper itself, read at the Society in March last, with an extract of a letter from Captain Cook to the President, dated Plymouth, the 7th of July following, are both subjoined to this discourse.]

I shall not, however, expatiate on that ample field of praise, but confine my discourse to what was the intention of this honorary premium, namely, to crown that Paper of the year which should contain the most useful and most successful experimental inquiry. Now what inquiry can be so useful as that which hath for its object the saving the lives of men? And when shall we find one more successful than that before us? Here are no vain boastings of the empiric, nor ingenious and delusive theories of the dogmatist; but a concise, an artless, and an uncontested relation of the means, by which, under the Divine favour, Captain Cook, with a company of an hundred and eighteen men*, performed a voyage of three years and eighteen days, throughout all the climates, from fifty-two degrees north, to seventy-one degrees south, with the loss of only one man by a distemper**. What must enhance to us the value of these salutary observations, is to see the practice hath been no less simple than efficacious.

[* There were on board, in all, one hundred and eighteen men, including M. Sparrman, whom they took in at the Cape of Good Hope.]

** This was a phthisis pulmonalis terminating in a dropsy. Mr. Patten, surgeon to the Resolution, who mentioned to me this case, observed that this man began so early to complain of a cough and other consumptive symptoms, which had never left him, that his lungs must have been affected before he came on board.]

I would now inquire of the most conversant in the study of bills of mortality, whether in the most healthful climate, and in the best condition of life, they have ever found so small a number of deaths in such a number of men, within that space of time? How great and agreeable then must our surprise be, after perusing the histories of long navigations in

former days, when so many perished by marine diseases, to find the air of the sea acquitted of all malignity, and in fine that a voyage round the world may be undertaken with less danger to health than a common tour in Europe!

But the better to see the contrast between the old and the present times, allow me to recal to your memory what you have read of the first voyage for the establishment of the East-India, Company*. The equipment consisting of four ships, with four hundred and eighty men, three of those vessels were so weakened by the scurvy, by the time they had got only three degrees beyond the Line, that the merchants, who had embarked on this adventure, were obliged to do duty as common sailors; and there died in all, at sea, and on shore at Soldania (a place of refreshment on this side the Cape of Good Hope) one hundred and five men, which was near a fourth part of their complement. And hath not Sir Richard Hawkins, an intelligent as well as brave officer, who lived in that age, recorded, that in twenty years, during which he had used the sea, he could give an account of ten thousand mariners who had been consumed by the scurvy alone**? Yet so far was this author from mistaking the disease, that I have perused few who have so well described it. If then in those early times, the infancy I may call them of the commerce and naval power of England, so many were carried off by that bane of sea-faring people, what must have been the destruction afterwards, upon the great augmentation of the fleet and the opening of so many new ports to the trade of Great Britain, whilst so little advancement was made in the nautical part of medicine!

[* This squadron under the command of LANCASTER (who was called the General) set out in the year 1601. See Purchas's Pilgr. vol. i. p. 147, et seq.]

[** Idem, vol. iv. p. 1373, et seq.]

But passing from these old dates to one within the remembrance of many here present, when it might have been expedited that whatever tended to aggrandize the naval power of Britain, and to extend her commerce, would have received the highest improvement; yet we shall find, that even at this late period few measures had been taken to preserve the health of seamen, more than had been known to our uninstructed ancestors. Of this assertion the victorious, but mournful, expedition of Commodore Anson, affords too convincing a proof. It is well known that soon after passing the Streights of Le Maire, the scurvy began to appear in his squadron; that by the time the Centurion had advanced but a little way into the South Sea, forty-seven had died of it in his ship; and that there were few on board who had not, in some degree, been afflicted with the distemper, though they had not been then eight months from England. That in the ninth month, when standing for the island of Juan Fernandez, the Centurion lost double that number; and that the mortality went on at so great a rate (I still speak of the Commodore's ship) that before they arrived there she had buried two hundred; and at last could muster no more than six of the the common men in a watch capable of doing duty. This was the condition of one of the three ships which reached that island; the other two suffered in proportion.

Nor did the tragedy end here for after a few months respite the same fatal sickness broke out afresh, and made such havock, that before the Centurion (which now contained the whole surviving crew of the three ships) had got to the island of Tinian, there died sometimes eight or ten in a day; insomuch that when they had been only two years on their voyage, they had lost a larger proportion than of four in five of their original number; and, by the account of the historian, all of them, after their entering the South Sea, of the scurvy. I say by the account of the elegant writer of this voyage; for as he neither was in the medical line himself, nor hath authenticated this part of his narrative by appealing to the surgeons of the ship or their journals, I should doubt that this was not strictly the case; but rather, that in producing this great mortality, a pestilential kind of distemper was joined to the scurvy, which, from the places where it most frequently occurs, hath been distinguished by the name of jail or hospital-fever*. But whether the scurvy alone, or this fever combined with it, were the cause, it is not at present material to inquire, since both, arising from foul air and other sources of putrefaction, may now in a great measure be obviated by the various means fallen upon since Lord Anson's expedition. For in justice to that prudent as well as brave commander, it must be observed that the arrangements preparatory to his voyage were not made by himself; that his ship was so deeply laden as not to admit of opening the gun-ports, except in the calmest weather, for the benefit of air; and that nothing appears to have been neglected by him, for preserving the health of his men, that was then known and practised in the navy.

[* Dr. Mead, who had seen the original observations of two of Commodore Anson's surgeons, says, that the scurvy at that time was accompanied with putrid fevers, etc. See his Treatise on the Scurvy, p. 98. et seq.]

I should now proceed to enumerate the chief improvements made since that period, and which have enabled our ships to make so many successful circumnavigations, as in a manner to efface the impression of former disasters; but as I have mentioned the sickness most destructive to mariners, and against the ravages of which those preservatives have been mainly contrived, it may be proper briefly to explain its nature, and the rather as, unless among mariners, it is little understood. First then, I would observe that the scurvy is not the ailment which goes by that name on shore. The

distemper commonly, but erroneously, in this place, called the scurvy, belongs to a class of diseases totally different from what we are now treating of; and so far is the commonly received opinion, that there are few constutions altogether free from a scorbutic taint, from being true, that unless among sailors and some others circumstanced like them, more particularly with respect to those who use a salt and putrid diet, and especially if they live in foul air and uncleanness, I have reason to believe there are few disorders less frequent. This opinion I submitted to the judgment of the society several years ago, and I have had no reason since to alter it. I then said, contrary to what was generally believed, but seemingly on the best grounds, that the sea-air was never the cause of the scurvy, since on board a ship, on the longest voyages, cleanliness, ventilation, and fresh provisions, would preserve from it; and that upon a sea-coast, free from marshes, the inhabitants were not liable to that indisposition, though frequently breathing the air from the sea*. I concluded with joining in sentiments with those who ascribed the scurvy to a septic resolution, that is a beginning corruption of the whole habit, similar to that of every animal substance when deprived of life**. This account seemed to be sufficiently verified by the examination of the symptoms in the scorbutic sick, and of the appearances in their bodies after death***. On that occasion I remarked, that salted meats after some time become in effect putrid, though they may continue long palatable by means of the salt; and that common salt, supposed to be one of the strongest preservatives from corruption, is at best but an indifferent one, even in a large quantity; and in a small one, such as we use at table with fresh meats, or swallow in meats that have been salted, so far from impeding putrefaction, it rather promotes that process in the body.

[* Diseases of the Army, part I. ch. 2. Append. Pap. 7.]

** Woodall's Surgeon's Mate, p. 163. Poupart. Mem. de l'Acad. R. des Sc. A. 1799. Petit. Mal. des Os, tom. II. p. 446. Mead on the Scurvy, p. 104.]

This position concerning the putrefying quality of sea-salt, in certain proportions, hath been since confirmed by the experiments of the late Mr. Canton, Fellow of this Society, in his Paper on the Cause of the luminous appearance of sea-water*.

[* Phil. Transact. vol. lix. p. 446.]

It hath been alleged, that the scurvy is much owing to the coldness of the air, which checks perspiration, and on that account is the endemic distemper of the northern nations, particularly of those around the Baltic*. The fact is partly true, but I doubt not so the cause. In those regions, by the long and severe winters, the cattle destitute of pasture can barely live, and are therefore unfit for use; so that the people, for their provision during that season, are obliged to slaughter them by the end of autumn, and to salt them for above half the year. This putrid diet then, on which they must subsist so long, and to which the inhabitants of the south are not reduced, seems to be the chief cause of the disease. And if we reflect that the lower people of the north have few or no greens nor fruit in the winter, scarce any fermented liquors, and often live in damp, foul, and ill-aired houses, it is easy to conceive how they should become liable to the same distemper with seamen; whilst others of as high a latitude, but who live in a different manner, keep free from it. Thus we are informed by Linnaeus, that the Laplanders, one of the most hyperborean nations, know nothing of the scurvy*; for which no other reason can be assigned than their never eating salted meats, nor indeed salt with any thing, but their using all the winter the fresh flesh of their rein-deer.

[* Bartholin. Med. Danor. Domestic p. 98.]

** Linnaei Flora Lapponica, p. 8, 9.]

This exemption of the Laplanders from the general distemper of the north is the more observable, as they seldom taste vegetables, bread never, as we farther learn from that celebrated author. Yet in the very provinces which border on Lapland, where they use bread, but scarcely any other vegetable, and eat salted meats, they are as much troubled with the scurvy as in any other country*. But let us incidentally remark, that the late improvements in agriculture, gardening, and the other arts of life, by extending their influence to the remotest parts of Europe, and to the lowest people, begin sensibly to lessen the frequency of that complaint, even in those climates that have been once the most afflicted with it.

[* Linnaeus in several parts of his work confirms what is here said of salted meats, as one of the chief causes of the scurvy. See Amoenitat. Acad. vol. v. p. 6. et seq. p. 42.]

It hath also been asserted, that men living on shore will be affected with the scurvy, though they have never been confined to salted meats; but of this I have never known any instance, except in those who breathed a marshy air, or what was otherwise putrid, and who wanted exercise, fruits, and green vegetables: under such circumstances it must be granted, that the humours will corrupt in the same manner, though not in the same degree, with those of mariners. Thus,

in the late war, when Sisinghurst Castle in Kent was filled with French prisoners, the scurvy broke out among them, notwithstanding they had never been served with salted victuals in England; but had daily had an allowance of fresh meat, and of bread in proportion, though without greens or any other vegetable. The surgeon who attended them, and from whom I received this information, having formerly been employed in the navy, was the better able to judge of the disorder and to cure it. Besides the deficiency of herbs, he observed that the wards were foul and crowded, the house damp (from a moat that surrounded it) and that the bounds allotted for taking the air were so small, and in wet weather so sloughy, that the men seldom went out. He added, that a representation having been made, he had been empowered to furnish the prisoners with roots and greens for boiling in their soup, and to quarter the sick in a neighbouring village in a dry situation, with liberty to go out for air and exercise; and that by these means they had all quickly recovered. It is probable, that the scurvy sooner appeared among these strangers, from their having been taken at sea, and consequently more disposed to the disease. My informer further acquainted me, that in the lower and wetter parts of that county, where some of his practice lay, he had now and then met with slighter cases of the scurvy among the common people; such, he said, as lived the whole winter on salted bacon, without fermented liquors, greens, or fruit, a few apples excepted; but, he remarked, that in the winters following a plentiful growth of apples, those peasants were visibly less liable to the disorder.

I have dwelt the longer on this part of my subject, as I look upon the knowledge of the nature and cause of the scurvy to be an essential step towards improving the means of prevention and cure. And I am persuaded, after mature reflection, and the opportunities I have had of conversing with those who, to much sagacity, had joined no small experience in nautical practice, that upon an examination of the several articles, which have either been of old approved, or have of late been introduced into the navy, it will be evident, that though these means may vary in form, and in their mode of operating; yet they all some way contribute towards preventing or correcting putrefaction, whether of the air in the closer parts of a ship, of the meats, of the water, of the clothes and bedding, or of the body itself. And if in this inquiry (which may be made by the way, whilst we take a review of the principal articles of provision, and other methods used by Captain Cook to guard against the scurvy) I say, if in this inquiry it shall appear, that the notion of a septic or putrid origin, is not without foundation, it will be no small encouragement to proceed on that principle, in order further to improve this important branch of medicine.

Captain Cook begins his list of stores with malt. Of this, he says, was made Sweet Wort, and given not only to those men who had manifest symptoms of the scurvy, but to such also as were judged to be most liable to it. Dr. Macbride, who first suggested this preparation, was led (as he says) to the discovery by some experiments that had been laid before this Society; by which it appeared that the air produced by alimentary fermentation was endowed with a power of correcting putrefaction*. The fact he confirmed by numerous trials, and finding this fluid to be *fixed air*, he justly concluded, that whatever substance proper for food abounded with it, and which could be conveniently carried to sea, would make one of the best provisions against the scurvy; which he then considered as a putrid disease, and as such to be prevented or cured by that powerful kind of antiseptic**. Beer, for instance, had always been esteemed one of the best antiscorbutics; but as that derived all its fixed air from the malt of which it is made, he inferred that malt itself was preferable in long voyages, as it took up less room than the brewed liquor, and would keep longer found. Experience hath since verified this ingenious theory, and the malt hath now gained so much credit in the navy, that there only wanted so long, so healthful, and so celebrated a voyage as this, to rank it among the most indispensable articles of provision. For though Captain Cook remarks, that *A proper attention to other things must be joined, and that he is not altogether of opinion, that the wort will be able to cure the scurvy in an advanced state at sea; yet he is persuaded that it is sufficient to prevent that distemper from making any great progress, for a considerable time*; and therefore he doth not hesitate to pronounce it *_one of the best antiscorbutic medicines yet found out****.

[* Append. to my *Observations on the Diseases of the Army*.]

** Macbride's *Exper. Eff. passim*.]

*** Having been favoured with a sight of the medical journal of Mr. Patten, surgeon to the Resolution, I read the following passage in it, not a little strengthening the above testimony. *I have found the wort of the utmost service in all scorbutic cases during the voyage. As many took it by way of prevention, few cases occurred where it had a fair trial; but theft, however, I flatter myself, will be sufficient to convince every impartial person, that it is the best remedy hitherto found out for the cure of the sea scurvy: and I am well convinced, from what I have seen the wort perform, and from its mode of operation, that if aided by portable-soup, sour krout, sugar, sago, and courants, then scurvy, that maritime pestilence, will seldom or never make its alarming appearance among a ship's crew, on the longest voyages; proper care with regard to cleanliness and provisions being observed.*]

This salutary gas (or *fixed air*) is contained more or less in all fermentable liquors, and begins to oppose putrefaction as soon as the working or intestine motion commences.

In wine it abounds, and perhaps no vegetable substance is more replete with it than the juice of the grape. If we join the grateful taste of wine, we must rank it the first in the list of antiscorbutic liquors. Cyder is likewise good, with other vinous productions from fruit, as also the various kinds of beer. It hath been a constant observation, that in long cruizes or distant voyages, the scurvy is never seen whilst the small-beer holds out, at a full allowance; but that when it is all expended, that ailment soon appears. It were therefore to be wished, that this most wholesome beverage could be renewed at sea; but our ships afford not sufficient convenience. The Russians however make a shift to prepare on board, as well as at land, a liquor of a middle quality between wort and small-beer, in the following manner. They take ground-malt and rye-meal in a certain proportion, which they knead into small loaves, and bake in the oven. These they occasionally infuse in a proper quantity of warm water, which begins so soon to ferment, that in the space of twenty-four hours their brewage is completed, in the production of a small, brisk, and acidulous liquor; they call *quas*, palatable to themselves, and not disagreeable to the taste of strangers. The late Dr. Mounsey, fellow of this Society, who had lived long in Russia, and had been *Archiater* under two successive sovereigns, acquainted me, that the *quas* was the common and wholesome drink both of the fleets and armies of that empire, and that it was particularly good against the scurvy. He added, that happening to be at Moscow when he perused my *Observations on the Jail and Hospital Fever*, then lately published*, he had been induced to compare what he read in that treatise with what he should see in the several prisons of that large city: but to his surprize, after visiting them all, and finding them full of malefactors (for the late Empress then suffered none of those who were convicted of capital crimes to be put to death) yet he could discover no fever among them, nor learn that any acute distemper peculiar to jails had ever been known there. He observed, that some of those places of confinement had a yard, into which the prisoners were allowed to come for the air; but that there were others without that advantage, yet not sickly: so that he could assign no other reason for the healthful condition of those men than the kind of diet they used, which was the same with that of the common people of the country; who not being able to purchase fresh-meat, live mostly on rye-bread (the most acescent of any) and drink *quas*. He concluded with saying, that upon his return to St. Petersburg he had made the same inquiry there, and with the same result.

[* That treatise was first published by itself, and afterwards incorporated with the *Observations on the Diseases of the Army*.]

Thus far Dr. Mounsey, from whose account it would seem, that the rye-meal assisted both in quickening the fermentation and adding more *fixed air*, since the malt alone could not so readily produce so tart and brisk a liquor. And there is little doubt but that whenever the other grains can be brought to a proper degree of fermentation, they will more or less in the same way become useful. That oats will, I am satisfied from what I have been told by one of the intelligent friends of Captain Cook. This gentleman being on a cruize in a large ship*, in the beginning of the late war, and the scurvy breaking out among his crew, he bethought himself of a kind of food he had seen used in some parts of the country, as the most proper on the occasion. Some oatmeal is put into a wooden vessel, hot water is poured upon it, and the infusion continues until the liquor begins to taste sourish, that is, till a fermentation comes on, which in a place moderately warm, may be in the space of two days. The water is then poured off from the grounds, and boiled down to the consistence of a jelly**. This he ordered to be made and dealt out in messes, being first sweetened with sugar, and seasoned with some prize French wine, which though turned sour, yet improved the taste, and made this aliment not less palatable than medicinal.

He assured me, that upon this diet chiefly, and by abstaining from salted meats, his scorbutic sick had quite recovered on board; and not in that voyage only, but, by the same means, in his subsequent cruizes during the war, without his being obliged to send one of them on shore because they could not get well at sea. Yet oat-meal unfermented, like barley unmalted, hath no sensible effect in curing the scurvy: as if the *fixed air*, which is incorporated with these grains, could mix with the chyle which they produce, enter the lacteals, and make part of the nourishment of the body, without manifesting any elastic or antiseptic quality, when not loosened by a previous fermentation.

[* The Essex, a seventy-gun ship.]

** This rural food, in the North, is called Sooins.]

Before the power of the *fixed air* in subduing putrefaction was known, the efficacy of fruits, greens, and fermented liquors, was commonly ascribed to the acid in their composition and we have still reason to believe that the acid concurs in operating that effect. If it be alleged that mineral acids, which contain little or no *fixed air*, have been tried in the scurvy with little success, I would answer, that I doubt that in those trials they have never been sufficiently diluted; for it is easy to conceive, that in the small quantity of water the elixir of vitriol, for instance, is commonly given, that austere acid can scarce get beyond the first passages; considering the delicate sensibility of the mouths of the lacteals, which must force them to shut and exclude so pungent a liquor. It were therefore a proper experiment to be made, in a deficiency of malt, or when that grain shall happen to be spoilt by keeping*, to use water acidulated with the spirit of

sea-salt, in the proportion of only ten drops to a quart; or with the weak spirit of vitriol, thirteen drops to the same measure**; and to give to those that are threatened with the disease three quarts of this liquor daily, to be consumed as they shall think proper.

[* Captain Cook told me, that the malt held out sufficiently good for the two first years; but that in the third, having lost much of its taste, he doubted whether it retained any of its virtues. Mr. Patten however observed, that though the malt at that time was sensibly decayed, yet nevertheless he had still found it useful when he employed a large proportion of it to make the infusion.]

[** In these proportions I found the water taste just acidulous and pleasant.]

But if the *fixed air* and acids are such preservatives against the scurvy, why should Captain Cook make so little account of the *rob* of lemons and of oranges (for so they have called the extracts or inspissated juices of those fruits) in treating that distemper? This I found was the reason. These preparations being only sent out upon trial, the surgeon of the ship was told, at a conjecture, how much he might give for a dose, but without strictly limiting it. The experiment was made with the quantity specified, but with so little advantage, that judging it not advisable to lose more time, he set about the cure with the wort only, whereof the efficacy he was certain; whilst he reserved these robs for other purposes; more particularly for colds, when, to a large draught of warm water, with some spirits and sugar, he added a spoonful of one of them, and with this composition made a grateful sudorific that answered the intention. No wonder then if Captain Cook, not knowing the proper dose of these concentrated juices for the scurvy, but seeing them fail as they were given in the trial, should entertain no great opinion of their antiscorbutic virtue. It may be also proper to take notice, that as they had been reduced to a small proportion of their bulk by evaporation upon fire, it is probable, they were much weakened by that process, and that with their aqueous parts they had lost not a little of their aerial, on which so much of their antiseptic power depended. If, therefore, a further trial of these excellent fruits were to be made, it would seem more advisable to send to sea the purified juices entire in casks; agreeably to a proposal I find hath been made to the Admiralty some years ago by an ingenious and experienced surgeon of the navy. For in truth, the testimonies in favour of the salutary qualities of these acids are so numerous and so strong, that I should look upon some failures, even in cases where their want of success cannot so well be accounted for, as in this voyage, not a sufficient reason for striking them out of the list of the most powerful preservatives against this consuming malady of sailors.

It may be observed, that Captain Cook says not more in praise of vinegar than of the *robs*; yet I would not thence infer that he made no account of that acid, but only that as he happened in this voyage to be sparingly provided with it and yet did well, he could not consider a large store of vinegar to be so material an article of provision as was commonly imagined. And though he supplied its place in the messes of the men with the acid of the sour-croute, and trusted chiefly to fire for purifying his decks, yet it is to be hoped that future navigators will not therefore omit it. Vinegar will serve at least for a wholesome variety in the seasoning of salted meats, and may be sometimes successfully used as a medicine, especially in the aspersions of the berths of the sick. It is observable, that though the smell be little grateful to a person in health, yet it is commonly agreeable to those who are sick, at least to such as are confined to a foul and crowded ward. There the physician himself will smell to vinegar, as much for pleasure as for guarding against infection.

Now the wort and the acid juices were only dispensed as medicines, but the next article was of more extensive use. This was the Sour-Croute (sour cabbage), a food of universal request in Germany. The acidity is acquired by its spontaneous fermentation, and it was the sour taste which made it the more acceptable to all who ate it. To its further commendation we may add, that it held out good to the last of the voyage.

It may seem strange, that though this herb hath had so high encomiums bestowed upon it by the ancients (witness what Cato the elder and Pliny the Naturalist say on the subject), and hath had the sanction of the experience of nations for ages, it should yet be disapproved of by some of the most distinguished medical writers of our times. One finds it yield a rank smell in decoction, which he confounds with that of putrefaction. Another analyzes it, and discovers so much gross air in the composition as to render it indigestible; yet this flatulence, so much decried, must now be acknowledged to be the *fixed air*, which makes the cabbage so wholesome when fermented. Nay it hath been traduced by one of the most celebrated physicians of our age, as partaking of a poisonous nature: nor much better founded was that notion of the same illustrious professor, that cabbage being an alcalescent plant, and therefore disposing to putrefaction, could never be used in the scurvy, except when the disease proceeded from an acid. But the experiments which I formerly laid before the Society evinced this vegetable, with the rest of the supposed alcalescents, to be really acescent; and proved that the scurvy is never owing to acidity, but, much otherwise, to a species of putrefaction; that very cause, of which the ill-grounded class of alcalescents was supposed to be a promoter*.

[* See this remark more at large, in my Observations on the Diseases of the Army, App. Pap. 7.]

Among other of the late improvements of the naval stores we have heard much of the Portable-Soup, and accordingly we find that Captain Cook hath not a little availed himself of it in his voyage. This concentrated broth being freed from all fat, and having by long boiling evaporated the most putrescent parts of the meat, is reduced to the consistence of a glue, which in effect it is, and will, like other glues, in a dry place, keep sound for years together. It hath been said, that broths turn sour on keeping, though made without any vegetable*. Now, whether any real acid can be thus formed or not, I incline at least to believe that the gelatinous parts of animal substances, such as compose these cakes, are not of a nature much disposed to putrefy. But however that may be, since Captain Cook observes, that this soup was the means of making his people eat a greater quantity of greens than they would have done otherwise, in so far we must allow it to have been virtually antiseptic.

[* La feule matiere qui s'aigriffe dans le sang est la matiere gelatincuse, etc. Senac, Structure du Coeur, 1. iii. ch. 4. para. 5.]

So much for those articles that have of late been supplied to all the king's ships on long voyages, and in which therefore our worthy brother claims no other merit than the prudent dispensation of them; but what follows being regulations either wholly new, or improven hints from some of his experienced friends, we may justly appropriate them to himself.

First then, he put his people at three watches, instead of two, which last is the general practice at sea; that is, he divided the whole crew into three companies, and by putting each company upon the watch by turns, four hours at a time, every man had eight hours free, for four of duty: whereas at watch and watch, the half of the men being on duty at once, with returns of it every four hours, they can have but broken sleep, and when exposed to wet, they have not time to get dry before they lie down. When the service requires it, such hardships must be endured; but when there is no pressing call, ought not a mariner to be refreshed with as much uninterrupted rest as a common day-labourer?

I am well informed, that an officer distinguishes himself in nothing more than in preserving his men from wet and the other injuries of the weather. These were most essential points with this humane commander. In the torrid zone he shaded his people from the scorching sun by an awning over his deck, and in his course under the antarctic circle he had a coat provided for each man, of a substantial woollen stuff, with the addition of a hood for covering their heads. This garb (which the sailors called their Magellan jacket) they occasionally wore, and found it more comfortable for working in rain and snow, and among the broken ice in the high latitudes of the South.

Let us proceed to another article, one of the most material, the care to guard against putrefaction, by keeping clean the persons, the cloaths, bedding, and berths of the sailors. The Captain acquainted me, that regularly, one morning in the week, he passed his ship's company in review, and saw that every man had changed his linen, and was in other points as clean and neat as circumstances would permit. It is well known how much cleanliness is conducive to health, but it is not so obvious how much it also tends to good order and other virtues. That diligent officer was persuaded (nor was perhaps the observation new) that such men as he could induce to be more cleanly than they were disposed to be of themselves, became at the same time more sober, more orderly, and more attentive to their duty. It must be acknowledged that a seaman has but indifferent means to keep himself clean, had he the greatest inclination to do it; for I have not heard that commanders of ships have yet availed themselves of the *still* for providing fresh water for washing; and it is well known that sea-water doth not mix with soap, and that linen wet with brine never thoroughly dries. But for Captain Cook, the frequent opportunities he had of taking in water among the islands of the South-Sea, enabled him in that tract to dispense to his ship's company some fresh water for every use; and when he navigated in the high latitudes of the Southern Oceans, he still more abundantly provided them with it, as you will find by the sequel of this discourse.

Of the hammocks and bedding I need say little, as all officers are now sensible, how much it concerns the health of their people to have this part of a ship's furniture kept dry and well-aired; since by the perspiration of so many men, every thing below, even in the space of twenty-four hours, is apt to contract an offensive moisture. But Captain Cook was not satisfied with ordering upon deck the hammocks and bedding every day that was fair (the common method) but took care that every bundle should be unlashed, and so spread out, that every part of it might be exposed to the air.

His next concern was to see to the purity of the ship itself, without which attention all the rest would have profited little. I shall not however detain you with the orders about washing and scraping the decks, as I do not understand that in this kind of cleansing he excelled others; but since our author has laid so great a stress upon *Fire*, as a purifier, I shall endeavour to explain the way of using it, more fully than he has done in his Paper. Some wood, and that not sparingly, being put into a proper stove or grate, is lighted, and carried successively to every part below deck. Wherever fire is, the air nearest to it being heated becomes specifically lighter, and by being lighter rises, and passes through the hatchways into the atmosphere. The vacant space is filled with the cold air around, and that being heated

in its turn, in like manner ascends, and is replaced by other air as before. Thus, by continuing the fire for some time, in any of the lower apartments, the foul air is in a good measure driven out, and the fresh admitted. This is not all: I apprehend that the acid steams of the wood, in burning, act here as an antiseptic and correct the corrupted air that remains.

An officer of distinguished rank, another of Captain Cook's experienced friends, mentioned to me a common and just observation in the fleet, which was, that all the old twenty-gun ships were remarkably less sickly than those of the same size of a modern construction. This, he said, was a circumstance he could not otherwise account for, than, by the former having their *galley** in the fore-part of the *orlop*** , the chimney vented so ill, that it was sure to fill every part with smoke whenever the wind was a-stern. This was a nuisance for the time, but, as he thought, abundantly compensated by the extraordinary good health of the several crews. Possibly those fire-places were also beneficial, by drying and ventilating the lower decks, more when they were below, than they can do now that they are placed under the fore-castle upon the upper deck.

[* Their fire-place or kitchen.]

** The deck immediately above the hold.]

But the most obvious use of the portable fires was their drying up the moisture, and especially in those places where there was the least circulation of air. This humidity, composed of the perspirable matter of a multitude of men, and often of animals (kept for a live-flock) and of the steams of the bilge water from the well, where the corruption is the greatest; this putrid moisture, I say, being one of the main sources of the scurvy, was therefore more particularly attended to, in order to its removal. The fires were the powerful instrument for that purpose, and whilst they burned, some men were employed in rubbing hard, with canvass or oakum, every part of the inside of the ship that was damp and accessible. But the advantage of fire appears no where so manifest as in cleansing the well; for this being in the lowest part of the hold, the whole leakage runs into it, whether of the ship itself, or of the casks of spoilt meats or corrupted water. The mephitic vapours, from this sink alone, have often been the cause of instantaneous death to those who have unwarily approached to clean it; and not to one only, but to several successively, when they have gone down to succour their unfortunate companions: yet this very place has not only been rendered safe but sweet, by means of an iron pot filled with fire and let down to burn in it.

When, from the circumstances of the weather, this salutary operation could not take place, the ship was fumigated with gun-powder, as described in the Paper; though that smoke could have no effect in drying, but only in remedying the corruption of the air, by means of the acid spirits from the sulphur and nitre, aided perhaps by some species of an aerial fluid, then disengaged from the fuel, to counteract putrefaction. But as these purifications by gun-powder, as well as by burning tar and other resinous substances, are sufficiently known, I shall not insist longer on them here.

Among the several means of sweetening or renewing the air, we should expect to hear of Dr. Hales's *Ventilator*. I must confess it was my expectation, and therefore, persuaded as I was of the excellence of the invention, it was not without much regret that I saw so good an opportunity lost, of giving the same favourable impression of it to the Public. If a degree of success, exceeding our most sanguine hopes, is not sufficient for justifying the omission of a measure, deemed one of the most essential for attaining an end, I would plead in favour of our worthy brother, that by a humiliating fatality, so often accompanying the most useful discoveries, the credit of this ventilator is yet far from being firmly established in the navy. What wonder then, if Captain Cook being so much otherwise taken up, should not have had time to examine it, and therefore avoided the encumbering his ship with an apparatus, he had possibly never seen used, and of which he had at best received but a doubtful character? Nor was he altogether unprovided with a machine for ventilation. He had the *Wind-Sails*, though he hath not mentioned them in his Paper, and he told me that he had found them at times very serviceable, and particularly between the Tropics. They have the merit of taking up little room, they require no labour in working, and the contrivance is so simple that they can sail in no hands. But their powers are small in comparison with those of the ventilator; they cannot be put up in hard gales of wind, and they are of no efficacy in dead calms, when a refreshment of the air is most wanted. Should there be any objection to the employing both?

Such were the measures taken by our sagacious Navigator for procuring a purity of air. It remains only to see in what manner he supplied pure water; another article of so great moment, that the thirsty voyager, upon his salt and putrid diet, with a short allowance of this element, and that in a corrupted Rate, must account a plentiful provision of fresh water to be indeed the *best of things*.

Captain Cook was not without an apparatus for distilling sea-water, and though he could not obtain nearly so much as was expected from the invention, yet he sometimes availed himself of it; but for the most of his voyage he was

otherwise provided. Within the Southern Tropic, in the Pacific Ocean, he found so many islands, and those so well stored with springs, that, as I have hinted before, he seldom was without a sufficiency of fresh water for every useful purpose. But not satisfied with plenty, he would have the purest; and therefore whenever an opportunity offered, he emptied what he had taken in but a few days before, and filled his casks anew. But was he not above four months in his passage from the Cape of Good Hope to New Zealand, in the frozen zone of the South, without once seeing land? and did he not actually complete his circumnavigation, in that high latitude, without the benefit of a single fountain? Here was indeed a *wonder of the Deep*! I may call it the *Romance of his Voyage*! Those very shoals, fields, and floating mountains of ice, among which he steered his perilous course, and which presented such terrifying prospects of destruction; those, I say, were the very means of his support, by supplying him abundantly with what he most wanted. It had been said that those stupendous masses of ice, called *islands or mountains*, melted into fresh water, though Crantz, the relator of that paradox, did not imagine they originated from the sea, but that they were first formed in the great rivers of the North, and being carried down into the ocean, were afterwards increased to that amazing height by the snow that fell upon them*. But that all frozen sea-water would thaw into fresh, had either never been asserted, or had met with little credit. This is certain that Captain Cook expected no such transmutation, and therefore was agreeably surprised to find he had one difficulty less to encounter, that of preserving the health of his men so long on salt-provisions, with a scanty allowance of corrupted water, or what he could procure by distillation. The melted ice of the sea was not only fresh but soft, and so wholesome, as to show the fallacy of human reason unsupported by experiments. An ancient of great authority had assigned, from theory, bad qualities to melted snow; and from that period to the present times, this prejudice extended to ice had not been quite removed.

[* Hist. of Greenland, b. I. ch. ii. para 11, 12.]

In this circumnavigation, amidst sleets and falls of snow, fogs, and much moist weather, the *Resolution* enjoyed nearly the same good state of health she had done in the temperate and torrid zones. It appears only from the journal of the Surgeon, that towards the end of the first course* some of the crew began to complain of the scurvy; but the disease made little progress, except in one who had become early an invalid from another cause. The other disorders were likewise inconsiderable, such as common colds, slight diarrhoeas, and intermittents that readily yielded to the Bark: there were also some fevers of a continued form, but which by timely care never rose to an alarming height. Much commendation is therefore due to the attention and abilities of Mr. PATTEN, the Surgeon of the *Resolution*, for having so well seconded his Captain in the discharge of his duty. For it must be allowed, that in despite of the best regulations and the best provisions, there will always be among a numerous crew, during a long voyage, some casualties more or less productive of sickness; and that unless there be an intelligent medical assistant on board, many under the wisest Commander will perish, that otherwise might have been saved.

[* Viz. The voyage between the Cape of Good Hope and New Zealand.]

These, Gentlemen, are the reflections I had to lay before you on this interesting subject; and if I have encroached on your time, you will recollect that much of my discourse hath been employed in explaining some things but just mentioned by Captain Cook, and in adding other materials, which I had procured partly from himself, and partly, after his departure, from those intelligent friends he alludes to in his Paper. This was my plan; which, as I have now executed, you will please to return your thanks to those gentlemen, who, on your account, so cheerfully communicated to me their observations.

As to your acknowledgments to Captain Cook, and your high opinion of his deserts, you will best testify them by the honourable distinction suggested by your Council, in presenting him with this medal: for I need not gather your suffrages, since the attention with which you have favoured me hath abundantly expressed your approbation. My satisfaction therefore had been complete, had he himself been present to receive the honours you now confer upon him. But you are apprized that our brave and indefatigable Brother is at this instant far removed from us, anticipating, I may say, your wonted request on these occasions, by continuing his labours for the advancement of Natural Knowledge, and for the honour of this Society: as you may be assured, that the object of his new enterprize is not less great, perhaps still greater than either of the former.

Allow me then, GENTLEMEN, to deliver this medal, with his unperishing name engraven upon it, into the hands of one who will be happy to receive that trust, and to know that this respectable Body never more cordially nor more meritoriously bestowed that faithful symbol of their esteem and affection. For if Rome decreed the *Civic Crown* to him who saved the life of a single citizen, what wreaths are due to that Man, who, having himself saved many, perpetuates in your Transactions the means by which Britain may now, on the most distant voyages, preserve numbers of her intrepid sons, her Mariners; who, braving every danger, have so liberally contributed to the fame, to the opulence, and to the maritime empire, of their Country*.

[* Here followed Captain Cook's Paper, which was presented to the Society, and is inserted in part 2. vol. lxvi. of the Philosophical Transactions; but as the Substance of that Publication is now contained in the last pages of Captain Cook's Voyage, it was judged unnecessary to repeat it here. The only material circumstance of Captain Cook's communication to the Society, omitted in his journal, is the following Extract of a Letter which he wrote to the President, just before his late embarkation, dated *Plymouth Sound*, July 7, 1776; and is as follows:

"I entirely agree with you, that the dearness of the Rob of lemons, and of oranges, will hinder them from being furnished in large quantities; but I do not think this so necessary, for though they may assist other things, I have no great opinion of them alone. Nor have I a higher opinion of vinegar: my people had it very sparingly during the late voyage; and towards the latter part, none at all; and yet we experienced no ill effects from the want of it. The custom of washing the inside of the ship with vinegar I seldom observed, thinking that fire and smoke answered the purpose much better."]

END OF VOLUME II.
